Abstract

For $0 \leq \alpha < 1$, the α -spectral radius of a graph G is defined as the largest eigenvalue of $A_\alpha(G) = \alpha D(G) + (1 - \alpha)A(G)$, where $D(G)$ and $A(G)$ are the diagonal matrix of degrees and adjacency matrix of G , respectively. A graph is called color-critical if it contains an edge whose deletion reduces its chromatic number. The celebrated Erdős-Stone-Simonovits theorem asserts that $\text{ex}(n, \mathcal{F}) = \left(1 - \frac{1}{\chi(\mathcal{F})-1} + o(1)\right) \frac{n^2}{2}$, where $\chi(\mathcal{F})$ is the chromatic number of \mathcal{F} . Nikiforov and Zheng et al. established the adjacency spectral and signless Laplacian spectral versions of this theorem, respectively. In this paper, we present the α -spectral version of this theorem, which unifies the aforementioned results. Furthermore, we characterize the α -spectral extremal graphs for color-critical graphs, thereby extending the existing results on adjacency spectral and signless Laplacian spectral extremal graphs for such graphs.

Keywords: α -spectral radius; Erdős-Stone-Simonovits theorem, color-critical graph, extremal graph

1 Introduction

Let $G = (V(G), E(G))$ be a simple graph with vertex set $V(G)$ and edge set $E(G)$. As usual, we use $|G|$ and $e(G)$ to represent the number of vertices and edges of a graph G , respectively. For $v \in V(G)$, the neighbors of v in G are denoted by $N_G(v)$, and $d_G(v) = |N_G(v)|$ denotes its degree in G . If there is no ambiguity, we simplify $N_G(v)$ and $d_G(v)$ as $N(v)$ and $d(v)$, respectively. We write $\Delta(G)$ for the maximum degree of G and $\delta(G)$ for the minimum degree of G . Let $T_{n,r}$ denote the r -partite Turán graph of order n . The k -vertex independent set is denoted by I_k . For two graphs G and H , the disjoint union of G and H is denoted by $G \cup H$. The *join* of G and H , denoted by $G \vee H$, is the graph obtained from $G \cup H$ by adding all possible edges between G and H . Denote $S_{n,k} = K_k \vee I_{n-k}$ and $S_{n,k}^+ = K_k \vee (K_2 \cup I_{n-k-2})$. Let M_{k+1} be a matching of size $k+1$ and P_k be a path of order k . A cycle on k vertex is denoted by C_k . A graph is called *color-critical* if it contains an edge whose deletion reduces its chromatic number.

Let \mathcal{F} be a family of graphs. A graph is called \mathcal{F} -free if it does not contain any member of \mathcal{F} as a subgraph. The classic *Turán type problem* is to determine the maximum number of edges over all \mathcal{F} -free graphs of order n . The *Turán number* of \mathcal{F} is defined as follows:

$$\text{ex}(n, \mathcal{F}) = \max\{|e(G)| \mid G \text{ is an } n\text{-vertex } \mathcal{F}\text{-free graph}\}.$$

Let $\chi(\mathcal{F}) = \min_{F \in \mathcal{F}} \chi(F)$. When $\mathcal{F} = \{F\}$, we simplify the notation to $\text{ex}(n, F)$ instead of $\text{ex}(n, \{F\})$. The same simplification applies to all other relevant functions. The *Turán density* of \mathcal{F} is defined as

$$\pi(\mathcal{F}) := \lim_{n \rightarrow \infty} \frac{\text{ex}(n, \mathcal{F})}{\binom{n}{2}},$$

for which the existence is guaranteed by an averaging argument due to Katona, Nemetz and Simonovits in [11].

Let G be a graph with adjacency matrix $A(G)$, and let $D(G)$ be the diagonal matrix of the degrees of G . The *signless Laplacian matrix* of a graph G is defined as $Q(G) := D(G) + A(G)$. In 2017, Nikiforov [18] proposed to study the convex combinations $A_\alpha(G)$ of $A(G)$ and $D(G)$ defined by

$$A_\alpha(G) := \alpha D(G) + (1 - \alpha)A(G), \quad 0 \leq \alpha < 1.$$

Obviously, $A(G) = A_0(G)$ and $Q(G) = 2A_{1/2}(G)$. The largest eigenvalue of $A_\alpha(G)$ is called the α -spectral radius of G , denoted by $\lambda_\alpha(G)$. The $\lambda_0(G)$ (resp. $2\lambda_{1/2}(G)$) of G is usually referred to as the spectral radius (resp. signless Laplacian spectral radius) of G , denoted by $\lambda(G)$ (resp. $q(G)$). In 2017, Nikiforov [18] proposed the following problem.

Problem 1.1. *Given a family of graphs \mathcal{F} , what is the maximum $\lambda_\alpha(G)$ of a graph G of order n , with no subgraph isomorphic to any $F \in \mathcal{F}$?*

Let $\text{ex}_\alpha(n, \mathcal{F})$ denote the maximum α -spectral radius among all \mathcal{F} -free graphs of order n . An \mathcal{F} -free graph of order n that achieves $\text{ex}_\alpha(n, \mathcal{F})$ is called an α -spectral extremal graph for \mathcal{F} , and we let $\text{Ex}_\alpha(n, \mathcal{F})$ denote the family of all such graphs. For specific spectral parameters, $\text{ex}_\lambda(n, \mathcal{F})$ stands for the maximum spectral radius of \mathcal{F} -free graphs of order n , while $\text{ex}_q(n, \mathcal{F})$ denotes the maximum signless Laplacian spectral radius of \mathcal{F} -free graphs on n vertices.

The study of α -spectral Turán problem was initiated by Nikiforov [18], who determined the α -spectral extremal graphs corresponding to complete graphs. For matching M_{k+1} , Yuan and Shao [22] showed that $\text{Ex}_\alpha(n, M_{k+1}) = S_{n,k}$. Further advancing the field, Chen, Liu, and Zhang [3] proved that $\text{Ex}_\alpha(n, P_{2k+2}) = S_{n,k}$ and $\text{Ex}_\alpha(n, P_{2k+3}) = S_{n,k}^+$, shedding light on the α -spectral extremal structures for paths of specific lengths. For cycles, Li and Yu [12] showed that $\text{Ex}_\alpha(n, C_{2k+2}) = S_{n,k}^+$ and $\text{Ex}_\alpha(n, \{C_{2k+1}, C_{2k+2}\}) = S_{n,k}$. Expanding to disjoint cycles, Li, Yu, and Zhang [13] determined the α -spectral extremal graphs, they obtained $\text{Ex}_\alpha(n, \mathcal{F}) = S_{n,2k-1}$, where \mathcal{F} is the family of all disjoint unions of k cycles. A nice result was achieved by Chen et al. [4], who proved the α -spectral Erdős-Sós theorem. This theorem asserts that every n -vertex graph G with $\lambda_\alpha(G) \geq \lambda_\alpha(S_{n,k})$ contains all trees on $2k+2$ vertices unless $G = S_{n,k}$. Moreover, if $\lambda_\alpha(G) \geq \lambda_\alpha(S_{n,k}^+)$, then G contains all trees on $2k+3$ vertices unless $G = S_{n,k}^+$. Most recently, Byrne, Desai, and Tait [2] established a unified framework that characterizes the α -spectral extremal graphs for a broad class of graph families.

1.1 The spectral version Erdős-Stone-Simonovits theorem

The famous Erdős-Stone-Simonovits theorem gives an asymptotic value of the Turán number for a family of graphs.

Theorem 1.2 (Erdős-Stone-Simonovits [5, 6]). *If \mathcal{F} is a family of graphs with $\chi(\mathcal{F}) \geq 2$, then*

$$\text{ex}(n, \mathcal{F}) = \left(1 - \frac{1}{\chi(\mathcal{F}) - 1} + o(1)\right) \frac{n^2}{2}.$$

As a direct consequence of Theorem 1.2, we have $\pi(\mathcal{F}) = 1 - \frac{1}{\chi(\mathcal{F}) - 1}$. Nikiforov [17] later proposed a spectral analog of the Erdős-Stone-Simonovits theorem, stated as follows.

Theorem 1.3 (Nikiforov [17]). *If F is a graph with $\chi(F) \geq 2$, then*

$$\text{ex}_\lambda(n, F) = \left(1 - \frac{1}{\chi(F) - 1} + o(1)\right) n.$$

More recently, Zheng, Li, and Su [24] established the signless Laplacian spectral counterpart of this theorem.

Theorem 1.4 (Zheng, Li, and Su [24]). *If F is a graph with $\chi(F) \geq 3$, then*

$$\text{ex}_q(n, F) = \left(1 - \frac{1}{\chi(F) - 1} + o(1)\right) 2n.$$

For a bipartite graph F , Zheng, Li, and Su [24] also derived the following result.

Theorem 1.5 (Zheng, Li, and Su [24]). *If F is a bipartite graph, i.e., $\chi(F) = 2$, then*

$$\text{ex}_q(n, F) = \begin{cases} (1 + o(1)) n & \text{if } F \text{ is not a star;} \\ 2(k - 1) & \text{if } F \text{ is a star } K_{1,k}. \end{cases}$$

1.2 The spectral extremal results for color-critical graphs

In 2007, Nikiforov [15] showed that if G is a K_{r+1} -free graph on n vertices, then $\lambda(G) \leq \lambda(T_{n,r})$, with equality if and only if $G = T_{n,r}$. Subsequently, He, Jin, and Zhang [9] extended this line of research to the signless Laplacian spectral radius, establishing the following theorem:

Theorem 1.6 (He, Jin, and Zhang [9]). *If G is an n -vertex K_{r+1} -free graph, then*

$$q(G) \leq q(T_{n,r}).$$

Moreover, the equality holds if and only if G is a complete bipartite graph for $r = 2$ and the r -partite Turán graph $T_{n,r}$ for every $r \geq 3$.

Later, Nikiforov [18] generalized the aforementioned results and obtained the following theorem.

Theorem 1.7 (Nikiforov [18]). *Let $r \geq 2$ and G be a K_{r+1} -free graph of order n .*

- (1) *If $0 \leq \alpha < 1 - \frac{1}{r}$, then $\lambda_\alpha(G) < \lambda_\alpha(T_{n,r})$, unless $G = T_{n,r}$.*
- (2) *If $1 > \alpha > 1 - \frac{1}{r}$, then $\lambda_\alpha(G) < \lambda_\alpha(S_{n,r-1})$, unless $G = S_{n,r-1}$.*
- (3) *If $\alpha = 1 - \frac{1}{r}$, then $\lambda_\alpha(G) \leq (1 - \frac{1}{r})n$, with equality if and only if G is a complete r -partite graph.*

Color-critical graphs form a broad and fundamental class of graphs. Examples include cliques, odd cycles, book graphs, and even wheels—all of which are color-critical. Let F be a color-critical graph with $\chi(F) = r + 1$. Simonovits [19] determined the Turán number of F , proving that $\text{Ex}(n, F) = T_{n,r}$ for sufficiently large n . Nikiforov [16] established a spectral counterpart to this result, showing that $\text{ex}_\lambda(n, F) = \lambda(T_{n,r})$. Subsequently, Zheng, Li, and Li [23] settled the signless Laplacian spectral extremal problem for F , determining $\text{ex}_q(n, F)$ explicitly.

Theorem 1.8 (Zheng, Li, and Li [23]). *Let F be a color-critical graph with $\chi(F) = r + 1 \geq 4$. Then there exists n_0 such that for every F -free graph G on $n \geq n_0$ vertices, we have*

$$q(G) \leq q(T_{n,r}),$$

where the equality holds if and only if G is the r -partite Turán graph $T_{n,r}$.

2 Main results

Given a family of graphs with $\chi(\mathcal{F}) = r + 1 \geq 3$, we first establish the asymptotic value of $\text{ex}_\alpha(n, \mathcal{F})$ as follows.

Theorem 2.1. *Let \mathcal{F} be a family of graphs with $\chi(\mathcal{F}) = r + 1 \geq 3$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$. Then*

$$\text{ex}_\alpha(n, \mathcal{F}) = \left(1 - \frac{1}{r} + o(1)\right)n.$$

Remark. Theorem 2.1 does not hold when $\alpha > 1 - \frac{1}{r}$. Nikiforov [18] proved that $\text{Ex}_\alpha(n, K_{r+1}) = S_{n,r-1}$ for $r \geq 2$ and $1 > \alpha > 1 - \frac{1}{r}$. Clearly, $\lambda_\alpha(S_{n,r-1}) \geq \alpha(n-1) > (1 - \frac{1}{r} + o(1))n$ for sufficiently large n .

Suppose G is an \mathcal{F} -free graph of order n . By Lemma 3.2 (stated in Section 3, which asserts $e(G) \leq \lambda_\alpha(G)\frac{n}{2}$) and Theorem 2.1, we have $e(G) \leq \lambda_\alpha(G)\frac{n}{2} \leq (1 - \frac{1}{r} + o(1))\frac{n^2}{2}$. Thus, Theorem 2.1 implies Theorem 1.2 in the case where $\chi(\mathcal{F}) \geq 3$. For families \mathcal{F} containing a bipartite graph, we establish the following result.

Theorem 2.2. *Let \mathcal{F} be a family of graphs with $\chi(\mathcal{F}) = 2$ and $0 \leq \alpha < 1$. Then*

- (1) $\text{ex}_\alpha(n, \mathcal{F}) = (\alpha + o(1))n$ if \mathcal{F} does not contain $K_{1,k} \cup sK_1$ for any $k \geq 1, s \geq 0$.
- (2) $\text{ex}_\alpha(n, \mathcal{F}) = O(1)$ if \mathcal{F} contains $K_{1,k} \cup sK_1$ for some $k \geq 1, s \geq 0$. Particularly, if $\mathcal{F} = \{K_{1,k}\}$, then $\text{ex}_\alpha(n, \mathcal{F}) = k - 1$.

When $\alpha = 0$, Theorem 2.1 combined with Theorem 2.2 implies Theorem 1.3. Furthermore, setting $\alpha = \frac{1}{2}$, Theorems 2.1 and 2.2 readily yield Theorems 1.4 and 1.5.

For color-critical graphs F , we further determine the maximum α -spectral radius among all F -free graphs of order n .

Theorem 2.3. *Let F be a color-critical graph with $\chi(F) = r + 1 \geq 3$, and let G be an F -free graph of order n . For sufficiently large n and $0 \leq \alpha < 1 - \frac{1}{r}$, we have*

$$\lambda_\alpha(G) \leq \lambda_\alpha(T_{n,r}),$$

where equality holds if and only if $G = T_{n,r}$.

Remark. Theorem 2.3 does not hold when $\alpha = 1 - \frac{1}{r}$. Indeed, for this specific value of α , Theorem 1.7 asserts that $\text{Ex}_\alpha(n, K_{r+1})$ consists of all complete r -partite graphs.

Clearly, Theorem 2.3 extends Theorem 1.7 for $0 \leq \alpha < 1 - \frac{1}{r}$. When $\alpha = 0$, it recovers Nikiforov's spectral result for color-critical graphs [16]; when $\alpha = \frac{1}{2}$, it implies Theorem 1.8.

The *even wheel* of order $2k + 2$ is defined as $W_{2k+2} := K_1 \vee C_{2k+1}$. Notably, W_{2k+2} is color-critical with $\chi(W_{2k+2}) = 4$. By Theorem 2.3, we immediately obtain the following result.

Corollary 2.4. *For $k \geq 1$, $0 \leq \alpha < \frac{2}{3}$ and sufficiently large n , if G is a W_{2k+2} -free graph of order n , then*

$$\lambda_\alpha(G) \leq \lambda_\alpha(T_{n,3}),$$

where equality holds if and only if $G = T_{n,3}$.

The *generalized book graph* $B_{r,k}$ is defined as $B_{r,k} := K_r \vee I_k$. One can see that $B_{r,k}$ is a color-critical graph and $\chi(B_{r,k}) = r + 1$. Thus, Theorem 2.3 implies the following result.

Corollary 2.5. *Suppose $k \geq 1$ and $r \geq 2$. For sufficiently large n and $0 \leq \alpha < 1 - \frac{1}{r}$, if G is a $B_{r,k}$ -free graph of order n , then*

$$\lambda_\alpha(G) \leq \lambda_\alpha(T_{n,r}),$$

with equality if and only if $G = T_{n,r}$.

3 Preliminaries

For a graph G and integer $p \geq 1$, the *blow-up* of G , denoted by G^p , is the graph obtained from G by replacing each vertex of G by a set of p independent vertices and each edge of G by a complete bipartite graph $K_{p,p}$. A family of graphs \mathcal{G} is called *multiplicative* if $G \in \mathcal{G}$ implies $G^p \in \mathcal{G}$ for all integers $p \geq 1$. A family \mathcal{G} is said to be *hereditary* if it is closed under taking induced subgraphs.

Let \mathcal{F} be a family of graphs and \mathcal{G} be a class of \mathcal{F} -free graphs. If there exist $\varepsilon > 0$ and $N > 0$ such that every \mathcal{F} -free graph G on $n \geq N$ vertices with $\delta(G) \geq (\pi(\mathcal{F}) - \varepsilon)n$ is a subgraph of some member of \mathcal{G} , then we say that \mathcal{F} is *degree-stable* with respect to \mathcal{G} .

Given a family of graphs \mathcal{G} , let \mathcal{G}_n denote the collection of all n -vertex graphs contained in \mathcal{G} . For $0 \leq \alpha < 1$, we define

$$\lambda_\alpha(\mathcal{G}_n) = \max_{G \in \mathcal{G}_n} \lambda_\alpha(G).$$

Nikiforov [18] established the following results, which will be invoked in our proofs.

Lemma 3.1 (Nikiforov [18]). *Let G be a graph and $0 \leq \alpha \leq 1$. Then*

$$\alpha \Delta(G) \leq \lambda_\alpha(G) \leq \alpha \Delta(G) + (1 - \alpha) \lambda(G).$$

Lemma 3.2 (Nikiforov [18]). *Let $0 \leq \alpha \leq 1$. If G is of order n and m edges, then*

$$\lambda_\alpha(G) \geq \sqrt{\frac{1}{n} \sum_{u \in V(G)} d^2(u)} \quad \text{and} \quad \lambda_\alpha(G) \geq \frac{2m}{n}.$$

Equality holds in the second inequality if and only if G is regular. If $\alpha > 0$, equality holds in the first inequality if and only if G is regular.

Lemma 3.3. *For $r \geq 2$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$, let G be a graph of order n and let $\mathbf{x} = (x_1, \dots, x_n)$ be a non-negative unit eigenvector of $A_\alpha(G)$ corresponding to $\lambda_\alpha(G)$. Suppose $w \in V(G)$ satisfies $x_w = \min\{x_1, \dots, x_n\}$. Then*

$$\lambda_\alpha(G - w) \geq \lambda_\alpha(G) \frac{1 - 2x_w^2}{1 - x_w^2} - \alpha \frac{1 - nx_w^2}{1 - x_w^2}.$$

Proof. For simplicity, we write $x = x_w$. By the Rayleigh principle, it follows that

$$\begin{aligned} \lambda_\alpha(G) &= \mathbf{x}^T A_\alpha(G) \mathbf{x} \\ &= \sum_{uv \in E(G)} (\alpha x_u^2 + 2(1 - \alpha)x_u x_v + \alpha x_v^2) \\ &= \sum_{uv \in E(G-w)} (\alpha x_u^2 + 2(1 - \alpha)x_u x_v + \alpha x_v^2) + \sum_{u \in N(w)} (\alpha x^2 + 2(1 - \alpha)x x_u + \alpha x_u^2) \\ &\leq (1 - x^2) \lambda_\alpha(G - w) + \alpha d(w) x^2 + 2(1 - \alpha)x \sum_{u \in N(w)} x_u + \alpha \sum_{u \in N(w)} x_u^2. \end{aligned} \quad (1)$$

Note that $(1 - \alpha) \sum_{u \in N(w)} x_u = (\lambda_\alpha(G) - \alpha d(w))x$. Consequently, we obtain the following inequality:

$$\begin{aligned} &\alpha d(w) x^2 + 2(1 - \alpha)x \sum_{u \in N(w)} x_u + \alpha \sum_{u \in N(w)} x_u^2 \\ &\leq \alpha d(w) x^2 + 2(\lambda_\alpha(G) - \alpha d(w))x^2 + \alpha(1 - (n - d(w))x^2) \\ &= 2\lambda_\alpha(G)x^2 - \alpha n x^2 + \alpha. \end{aligned}$$

Combining this with (1), we obtain

$$\lambda_\alpha(G - w) \geq \lambda_\alpha(G) \frac{1 - 2x^2}{1 - x^2} - \alpha \frac{1 - nx^2}{1 - x^2}.$$

□

Lemma 3.4. Let \mathcal{G} be a hereditary graph family. For $r \geq 2$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$, if $\lambda_\alpha(\mathcal{G}_n) > (1 - \frac{1}{r})n - (1 - \frac{1}{r})$, then the limit

$$\pi_\alpha(\mathcal{G}) := \lim_{n \rightarrow \infty} \frac{\lambda_\alpha(\mathcal{G}_n)}{n}$$

exists, and it satisfies

$$\pi_\alpha(\mathcal{G}) \leq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1}.$$

Proof. Let $G \in \mathcal{G}_n$ satisfy $\lambda_\alpha(G) = \lambda_\alpha(\mathcal{G}_n)$, and let $\mathbf{x} = (x_1, \dots, x_n)$ be a non-negative unit eigenvector of $A_\alpha(G)$ corresponding to $\lambda_\alpha(G)$. Suppose $w \in V(G)$ such that $x_w = \min\{x_1, \dots, x_n\}$. Since \mathcal{G} is hereditary, $G - w \in \mathcal{G}_{n-1}$, which implies that $\lambda_\alpha(\mathcal{G}_{n-1}) \geq \lambda_\alpha(G - w)$. For simplicity, let $x = x_w$. Note that $x^2 \leq \frac{1}{n}$. By Lemma 3.3, we obtain

$$\lambda_\alpha(\mathcal{G}_{n-1}) \geq \lambda_\alpha(\mathcal{G}_n) \frac{1-2x^2}{1-x^2} - \alpha \frac{1-nx^2}{1-x^2}.$$

Thus,

$$\begin{aligned} \frac{\lambda_\alpha(\mathcal{G}_{n-1})}{n-2} &\geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \frac{1}{n-2}\right) \frac{1-2x^2}{1-x^2} - \alpha \frac{1-nx^2}{(n-2)(1-x^2)} \\ &= \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \frac{1-nx^2}{(n-2)(1-x^2)}\right) - \alpha \frac{1-nx^2}{(n-2)(1-x^2)} \\ &\geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1}, \end{aligned}$$

where the last inequality holds as $\lambda_\alpha(\mathcal{G}_n) > (1 - \frac{1}{r})n - (1 - \frac{1}{r})$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$.

Therefore, $\frac{\lambda_\alpha(\mathcal{G}_{n-1})}{n-2} \geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} > 0$. This implies that the limit $\pi_\alpha(\mathcal{G}) := \lim_{n \rightarrow \infty} \frac{\lambda_\alpha(\mathcal{G}_n)}{n}$ exists. Moreover, $\pi_\alpha(\mathcal{G}) \leq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1}$. \square

4 Proofs of Theorems 2.1 and 2.2

Lemma 4.1. For $r \geq 2$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$, let G be a graph on n vertices, and $\mathbf{x} = (x_1, \dots, x_n)$ be a non-negative unit eigenvector of $A_\alpha(G)$ corresponding to $\lambda_\alpha(G)$. Denote $x = \min\{x_1, \dots, x_n\}$ and $\delta = \delta(G)$. If $x > 0$, then

$$\lambda_\alpha(G) \leq \alpha\delta + (1-\alpha)\sqrt{\delta^2 + \left(\frac{1}{nx^2} - 1\right)n\delta}.$$

Proof. Let $u \in V(G)$ such that $d(u) = \delta$. According to the eigenvector equation with respect to u , we obtain

$$\frac{1}{1-\alpha}(\lambda_\alpha(G) - \alpha\delta)x_u = \sum_{v \in N(u)} x_v.$$

Hence,

$$\begin{aligned}
\left(\frac{1}{1-\alpha}\right)^2 (\lambda_\alpha(G) - \alpha\delta)^2 x^2 &\leq \left(\frac{1}{1-\alpha}\right)^2 (\lambda_\alpha(G) - \alpha\delta)^2 x_u^2 \\
&\leq \delta \sum_{v \in N(u)} x_v^2 \\
&\leq \delta(1 - (n - \delta)x^2),
\end{aligned}$$

which implies that

$$\lambda_\alpha(G) \leq \alpha\delta + (1 - \alpha) \sqrt{\delta^2 + \left(\frac{1}{nx^2} - 1\right) n\delta}.$$

□

Let \mathcal{F} be a family of graphs with $\chi(\mathcal{F}) = r + 1 \geq 3$, and let \mathcal{G} denote the collection of all \mathcal{F} -free graphs. Clearly, \mathcal{G} is a hereditary graph family, and $\lambda_\alpha(\mathcal{G}_n) = \text{ex}_\alpha(n, \mathcal{F})$. Note that the r -partite Turán graph $T_{n,r} \in \mathcal{G}_n$. By Lemma 3.2, we thus have

$$\lambda_\alpha(\mathcal{G}_n) \geq \lambda_\alpha(T_{n,r}) \geq \frac{2e(T_{n,r})}{n} \geq \left(1 - \frac{1}{r}\right)n - \frac{r}{4n}.$$

Furthermore, Lemma 3.4 guarantees the existence of the limit $\lim_{n \rightarrow \infty} \frac{\text{ex}_\alpha(n, \mathcal{F})}{n}$. We denote this limit as $\pi'_\alpha(\mathcal{F})$, so that $\pi'_\alpha(\mathcal{F}) = \pi_\alpha(\mathcal{G})$.

Lemma 4.2. *For $r \geq 2$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$, let \mathcal{F} be a family of graphs with $\chi(\mathcal{F}) = r + 1 \geq 3$. Then $\pi'_\alpha(\mathcal{F}) \geq \pi(\mathcal{F})$. Furthermore, if $\pi'_\alpha(\mathcal{F}) > 1 - \frac{1}{r}$, then $\pi'_\alpha(\mathcal{F}) = \pi(\mathcal{F})$.*

Proof. We first prove that $\pi'_\alpha(\mathcal{F}) \geq \pi(\mathcal{F})$. Let $G \in \text{Ex}(n, \mathcal{F})$. By Lemma 3.2,

$$\frac{\text{ex}_\alpha(n, \mathcal{F})}{n} \geq \frac{\lambda_\alpha(G)}{n} \geq \frac{2\text{ex}(n, \mathcal{F})}{n^2},$$

which implies that $\pi'_\alpha(\mathcal{F}) \geq \pi(\mathcal{F})$.

Now, suppose $\pi'_\alpha(\mathcal{F}) > 1 - \frac{1}{r}$. We will show $\pi'_\alpha(\mathcal{F}) \leq \pi(\mathcal{F})$, thus finishing the proof. Clearly, $\pi'_\alpha(\mathcal{F}) < 1$. So we assume $\pi'_\alpha(\mathcal{F}) = 1 - \frac{1}{r} + \varepsilon$, where $0 < \varepsilon < \frac{1}{r}$. Let \mathcal{G} be the collection of all \mathcal{F} -free graphs. Let $G_n \in \mathcal{G}_n$ such that $\lambda_\alpha(G_n) = \lambda_\alpha(\mathcal{G}_n)$. Suppose $\mathbf{x}^{(n)} = (x_1^{(n)}, \dots, x_n^{(n)})$ is a non-negative unit eigenvector of $A_\alpha(G_n)$ corresponding to $\lambda_\alpha(G_n)$. Denote $x^{(n)} = \min\{x_1^{(n)}, \dots, x_n^{(n)}\}$.

Claim 1. *There exist infinitely many $n \in \mathbb{N}$ such that*

$$\left(x^{(n)}\right)^2 > \frac{1}{n} \left(1 - \frac{1}{\ln n}\right) > 0.$$

Proof. Suppose, for contradiction, that there exists some n_0 such that for all $n \geq n_0$,

$$0 \leq \left(x^{(n)}\right)^2 \leq \frac{1}{n} \left(1 - \frac{1}{\ln n}\right).$$

Note that \mathcal{G} is a hereditary graph family. By Lemma 3.3, we thus have

$$\lambda_\alpha(\mathcal{G}_{n-1}) \geq \lambda_\alpha(\mathcal{G}_n) \frac{1 - 2(x^{(n)})^2}{1 - (x^{(n)})^2} - \alpha \frac{1 - n(x^{(n)})^2}{1 - (x^{(n)})^2}.$$

Moreover, since $\lambda_\alpha(\mathcal{G}_n) \geq \lambda_\alpha(T_{n,r}) \geq (1 - \frac{1}{r})n - \frac{r}{4n}$, it follows from Lemma 3.4 that $\frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \geq \pi_\alpha(\mathcal{G}) = \pi'_\alpha(\mathcal{F}) = 1 - \frac{1}{r} + \varepsilon$. Now, let $n \geq n_0$ and let $x = x^{(n)}$. Then we get

$$\begin{aligned} \frac{\lambda_\alpha(\mathcal{G}_{n-1})}{n-2} &\geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \frac{1}{n-2}\right) \frac{1-2x^2}{1-x^2} - \alpha \frac{1-nx^2}{(n-2)(1-x^2)} \\ &= \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \left(1 - \alpha \frac{n-1}{\lambda_\alpha(\mathcal{G}_n)}\right) \frac{1-nx^2}{(n-2)(1-x^2)}\right) \\ &\geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \frac{\varepsilon(1-nx^2)}{(n-2)(1-x^2)}\right) \\ &\geq \frac{\lambda_\alpha(\mathcal{G}_n)}{n-1} \left(1 + \frac{\varepsilon}{n \ln n}\right), \end{aligned}$$

where the second inequality holds as $0 \leq \alpha \leq 1 - \frac{1}{r}$ and $\frac{n-1}{\lambda_\alpha(\mathcal{G}_n)} \leq \frac{1}{1 - \frac{1}{r} + \varepsilon}$, and the last inequality holds as $x^2 \leq \frac{1}{n} \left(1 - \frac{1}{\ln n}\right)$. Thus, for any $i \geq n_0$, the following inequality holds:

$$\frac{\lambda_\alpha(\mathcal{G}_{i-1})}{i-2} - \frac{\lambda_\alpha(\mathcal{G}_i)}{i-1} \geq \frac{\varepsilon}{i \ln i} \cdot \frac{\lambda_\alpha(\mathcal{G}_i)}{i-1}.$$

Summing both sides over i from n_0 to $2n$, we further obtain

$$\begin{aligned} \frac{\lambda_\alpha(\mathcal{G}_{n_0-1})}{n_0-2} - \frac{\lambda_\alpha(\mathcal{G}_{2n})}{2n-1} &= \sum_{i=n_0}^{2n} \left(\frac{\lambda_\alpha(\mathcal{G}_{i-1})}{i-2} - \frac{\lambda_\alpha(\mathcal{G}_i)}{i-1} \right) \\ &\geq \sum_{i=n_0}^{2n} \frac{\varepsilon}{i \ln i} \cdot \frac{\lambda_\alpha(\mathcal{G}_i)}{i-1} \\ &\geq \varepsilon \pi'_\alpha(\mathcal{F}) \sum_{i=n_0}^{2n} \frac{1}{i \ln i}, \end{aligned}$$

where the last inequality holds as $\frac{\lambda_\alpha(\mathcal{G}_i)}{i-1} \geq \pi_\alpha(\mathcal{G}) = \pi'_\alpha(\mathcal{F})$. Taking n sufficiently large, we get a contradiction as $\sum_{i=n_0}^{2n} \frac{1}{i \ln i}$ diverges. This completes the proof of Claim 1. \square

By Claim 1, there exists an infinite sequence $\{n_k\}_{k=1}^\infty$ of positive integers such that for each $n \in \{n_k\}_{k=1}^\infty$,

$$(x^{(n)})^2 > \frac{1}{n} \left(1 - \frac{1}{\ln n}\right) > 0.$$

In light of Lemma 4.1, we deduce that

$$\begin{aligned}
\frac{\lambda_\alpha(G_n)}{n} &\leq \frac{\alpha\delta(G_n)}{n} + (1-\alpha)\sqrt{\left(\frac{\delta(G_n)}{n}\right)^2 + \left(\frac{1}{n(x^{(n)})^2} - 1\right)\frac{\delta(G_n)}{n}} \\
&\leq \frac{\alpha\delta(G_n)}{n} + (1-\alpha)\left(\frac{\delta(G_n)}{n} + \frac{1}{1 - \frac{1}{\ln n}} - 1\right) \\
&\leq \frac{2\text{ex}(n, \mathcal{F})}{n^2} + (1-\alpha)\left(\frac{1}{1 - \frac{1}{\ln n}} - 1\right).
\end{aligned}$$

Therefore, we obtain

$$\pi'_\alpha(\mathcal{F}) = \lim_{n \rightarrow \infty} \frac{\lambda_\alpha(G_n)}{n} \leq \lim_{n \rightarrow \infty} \left(\frac{2\text{ex}(n, \mathcal{F})}{n^2} + (1-\alpha)\left(\frac{1}{1 - \frac{1}{\ln n}} - 1\right) \right) = \pi(\mathcal{F}).$$

Thus, $\pi'_\alpha(\mathcal{F}) = \pi(\mathcal{F})$. The proof is complete. \square

We are now ready to prove Theorem 2.1.

Proof of Theorem 2.1. It suffices to show that $\pi'_\alpha(\mathcal{F}) = 1 - \frac{1}{r}$. We prove the assertion by contradiction. Recall that $\pi'_\alpha(\mathcal{F}) \geq \pi(\mathcal{F}) = 1 - \frac{1}{r}$. If $\pi'_\alpha(\mathcal{F}) > 1 - \frac{1}{r}$, then by Lemma 4.2, we deduce that $\pi'_\alpha(\mathcal{F}) = \pi(\mathcal{F}) = 1 - \frac{1}{r}$, which is a contradiction. Thus $\pi'_\alpha(\mathcal{F}) = \pi(\mathcal{F}) = 1 - \frac{1}{r}$. This completes the proof. \square

Next, we give the proof of Theorem 2.2.

Proof of Theorem 2.2. We first consider the case where \mathcal{F} does not contain $K_{1,k} \cup sK_1$ for any $k \geq 1, s \geq 0$. In this case, $K_{1,n-1}$ is \mathcal{F} -free. Let $G \in \text{Ex}_\alpha(n, \mathcal{F})$. By Lemma 3.1, we have $\lambda_\alpha(G) \geq \lambda_\alpha(K_{1,n-1}) \geq \alpha(n-1)$. Since $\chi(\mathcal{F}) = 2$, there exist a number $t > 0$ and $F \in \mathcal{F}$ such that $F \subset K_{t,t}$. By the well-known Kővári-Sós-Turán theorem, $\text{ex}(n, K_{t,t}) = O(n^{2-\frac{1}{t}})$. Therefore, by Lemma 3.1, we obtain

$$\alpha(n-1) \leq \lambda_\alpha(G) \leq \alpha\Delta(G) + (1-\alpha)\lambda(G) \leq \alpha(n-1) + (1-\alpha)\sqrt{2e(G)} = \alpha n + o(n).$$

Then $\text{ex}_\alpha(n, \mathcal{F}) = (\alpha + o(1))n$. Next, we assume \mathcal{F} contains $K_{1,k} \cup sK_1$ for some $k \geq 1, s \geq 0$. Then $\Delta(G) \leq k-1$. It follows from Lemma 3.1 that

$$\lambda_\alpha(G) \leq \alpha\Delta(G) + (1-\alpha)\lambda(G) \leq \Delta(G) \leq k-1.$$

Thus, $\text{ex}_\alpha(n, \mathcal{F}) = O(1)$. If $\mathcal{F} = \{K_{1,k}\}$, then $K_k \cup I_{n-k}$ is \mathcal{F} -free. Thus $\lambda_\alpha(G) \geq \lambda_\alpha(K_k \cup I_{n-k}) = k-1$. Hence, $\text{ex}_\alpha(n, \mathcal{F}) = k-1$. The proof is complete. \square

5 Proof of Theorem 2.3

5.1 Some auxiliary lemmas

Keavash, Lenz, and Mubayi [10] established a criterion that allows spectral extremal problems involving the p -spectral radius of hypergraphs to be deduced from their corresponding hypergraph Turán problems.

Zheng, Li, and Li [23] later proposed a similar criterion for the signless Laplacian spectral radius. Motivated by these works, we develop a criterion for the α -spectral radius, which reduces α -spectral Turán-type problems to classical extremal problems satisfying the degree-stable property.

Theorem 5.1. *Let \mathcal{F} be a family of graphs with $\chi(\mathcal{F}) = r + 1 \geq 3$. Suppose $0 < \varepsilon < \frac{1}{2}$, $\sigma < \frac{\varepsilon^3}{7}$ and $0 \leq \alpha \leq 1 - \frac{1}{r} - \varepsilon$. Let \mathcal{G}'_n be the set of all \mathcal{F} -free graphs on n vertices with minimum degree larger than $(\pi(\mathcal{F}) - \varepsilon)n$. Suppose that there exists $N > 0$ such that for every $n > N$, we have*

$$|\text{ex}(n, \mathcal{F}) - \text{ex}(n-1, \mathcal{F}) - \pi(\mathcal{F})n| \leq \sigma n \quad (2)$$

and

$$\left| \lambda_\alpha(\mathcal{G}'_n) - \frac{2\text{ex}(n, \mathcal{F})}{n} \right| \leq \sigma. \quad (3)$$

Then there exists $n_0 > 0$ such that for any \mathcal{F} -free graph G on $n \geq n_0$ vertices, we have

$$\lambda_\alpha(G) \leq \lambda_\alpha(\mathcal{G}'_n).$$

In addition, if the equality holds, then $G \in \mathcal{G}'_n$.

Now we prove Theorem 5.1. Let G be an \mathcal{F} -free graph on n vertices. Let $\mathbf{x} = (x_1, \dots, x_n)$ be a non-negative unit eigenvector of $A_\alpha(G)$ corresponding to $\lambda_\alpha(G)$. Suppose $w \in V(G)$ such that $x = x_w = \min\{x_1, \dots, x_n\}$. Let $\delta = \delta(G)$.

From (3), it is readily seen that $\frac{\lambda_\alpha(\mathcal{G}'_n)}{n} - \frac{2\text{ex}(n, \mathcal{F})}{n^2} = o(1)$. Recalling that $\pi(\mathcal{F}) = \lim_{n \rightarrow \infty} \frac{2\text{ex}(n, \mathcal{F})}{n^2}$, this immediately implies

$$\lambda_\alpha(\mathcal{G}'_n) = (\pi(\mathcal{F}) + o(1))n. \quad (4)$$

Clearly, $\delta(T_{n,r}) \geq (1 - 1/r)n - 1 > (1 - 1/r - \varepsilon)n$, and $T_{n,r}$ is \mathcal{F} -free. Thus, $T_{n,r} \in \mathcal{G}'_n$. Combining Lemma 3.2 with the known lower bound $e(T_{n,r}) \geq \frac{r-1}{2r}n^2 - \frac{r}{8}$, we deduce

$$\lambda_\alpha(\mathcal{G}'_n) \geq \left(1 - \frac{1}{r}\right)n - \frac{r}{4n}. \quad (5)$$

Lemma 5.2. $\lambda_\alpha(\mathcal{G}'_n) \geq \lambda_\alpha(\mathcal{G}'_{n-1}) + \pi(\mathcal{F}) - 5\sigma$.

Proof. By the triangle inequality, combining (2) and (3), we deduce that

$$\begin{aligned} & \left| \lambda_\alpha(\mathcal{G}'_n) - \lambda_\alpha(\mathcal{G}'_{n-1}) - \pi(\mathcal{F}) \right| \\ & \leq \left| \frac{2\text{ex}(n, \mathcal{F})}{n} - \frac{2\text{ex}(n-1, \mathcal{F})}{n-1} - \pi(\mathcal{F}) \right| + 2\sigma \\ & = \left| \frac{2}{n}(\text{ex}(n, \mathcal{F}) - \text{ex}(n-1, \mathcal{F}) - \pi(\mathcal{F})n) + \pi(\mathcal{F}) - \frac{2\text{ex}(n-1, \mathcal{F})}{n(n-1)} \right| + 2\sigma \\ & \leq \left| \pi(\mathcal{F}) - \frac{2\text{ex}(n-1, \mathcal{F})}{n(n-1)} \right| + 4\sigma. \end{aligned}$$

Note that $\lim_{n \rightarrow \infty} \frac{2\text{ex}(n-1, \mathcal{F})}{n(n-1)} = \pi(\mathcal{F})$. Thus, for sufficiently large n , we have

$$\lambda_\alpha(\mathcal{G}'_n) \geq \lambda_\alpha(\mathcal{G}'_{n-1}) + \pi(\mathcal{F}) - 5\sigma.$$

□

Lemma 5.3. $x^2 \leq \frac{\delta(1-\alpha)^2}{(\lambda_\alpha(G) - \alpha\delta)^2 + \delta(n-\delta)(1-\alpha)^2}.$

Proof. Let $u \in V(G)$ such that $d(u) = \delta$. According to the eigenvector equation with respect to the vertex u , we get

$$(\lambda_\alpha(G) - \alpha\delta)x_u = (1 - \alpha) \sum_{v \in N(u)} x_v.$$

Combining this with Power Mean inequality, we obtain

$$\begin{aligned} \left(\frac{1}{1-\alpha} (\lambda_\alpha(G) - \alpha\delta)x \right)^2 &\leq \left(\sum_{v \in N(u)} x_v \right)^2 \leq \delta \sum_{v \in N(u)} x_v^2 \\ &\leq \delta (1 - (n - \delta)x^2), \end{aligned}$$

which implies that

$$x^2 \leq \frac{\delta(1-\alpha)^2}{(\lambda_\alpha(G) - \alpha\delta)^2 + \delta(n-\delta)(1-\alpha)^2}.$$

□

Lemma 5.4. *If $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$ and $\delta \leq (\pi(\mathcal{F}) - \varepsilon)n$, then for sufficiently large n , we have*

$$x^2 < \frac{1 - \varepsilon^2}{n}.$$

Proof. If $\delta = 0$, then $x = 0$, the result follows. In the following, we assume $\delta \geq 1$. Set $\theta = \frac{\varepsilon}{2}$. By the assumption that $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$ and (5), we get

$$\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n) \geq \left(1 - \frac{1}{r}\right)n - \frac{r}{4n} \geq (\pi(\mathcal{F}) - \theta)n. \quad (6)$$

Let

$$f(y, z) = \frac{1}{y}(z - \alpha y)^2 + (n - y)(1 - \alpha)^2,$$

where $1 \leq y \leq (\pi(\mathcal{F}) - \varepsilon)n$ and $z \geq (\pi(\mathcal{F}) - \theta)n$.

A straightforward calculation shows

$$\frac{\partial f(y, z)}{\partial y} = -\left(\frac{z^2}{y^2} + 1 - 2\alpha\right) \text{ and } \frac{\partial f(y, z)}{\partial z} = 2\left(\frac{z}{y} - \alpha\right),$$

which implies that $\frac{\partial f(y, z)}{\partial y} \leq 0$ and $\frac{\partial f(y, z)}{\partial z} > 0$ for $1 \leq y \leq (\pi(\mathcal{F}) - \varepsilon)n$ and $z \geq (\pi(\mathcal{F}) - \theta)n$.

Combining this with (6) and assumption $\delta \leq (\pi(\mathcal{F}) - \varepsilon)n$, we get

$$f(\delta, \lambda_\alpha(G)) \geq f((\pi(\mathcal{F}) - \varepsilon)n, (\pi(\mathcal{F}) - \theta)n).$$

By Lemma 5.3, we have

$$\begin{aligned}
x^2 n &\leq \frac{(1-\alpha)^2}{f(\delta, \lambda_\alpha(G))} n \leq \frac{(1-\alpha)^2}{f((\pi(\mathcal{F}) - \varepsilon)n, (\pi(\mathcal{F}) - \theta)n)} n \\
&= \frac{(1-\alpha)^2(\pi(\mathcal{F}) - \varepsilon)}{((1-\alpha)(\pi(\mathcal{F}) - \varepsilon) + \varepsilon - \theta)^2 + (1-\alpha)^2(\pi(\mathcal{F}) - \varepsilon)(1 - \pi(\mathcal{F}) + \varepsilon)} \\
&= \frac{(1-\alpha)^2(\pi(\mathcal{F}) - \varepsilon)}{(1-\alpha)^2(\pi(\mathcal{F}) - \varepsilon) + 2(1-\alpha)(\pi(\mathcal{F}) - \varepsilon)(\varepsilon - \theta) + (\varepsilon - \theta)^2} \\
&\leq \frac{1}{1 + \frac{2(\varepsilon - \theta)}{1-\alpha}} < 1 - \varepsilon^2,
\end{aligned}$$

completing the proof. \square

Lemma 5.5. Suppose G satisfies $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$ and $x^2 < \frac{1-\varepsilon^2}{n}$. Then, for sufficiently large n , we have

$$\lambda_\alpha(G - w) \geq \lambda_\alpha(G) \left(1 - \frac{1 - \varepsilon^3}{n - 1}\right) \quad (7)$$

and

$$\lambda_\alpha(G - w) > \lambda_\alpha(\mathcal{G}'_{n-1}). \quad (8)$$

Proof. By Lemma 3.3, we obtain

$$\lambda_\alpha(G - w) \geq \lambda_\alpha(G) \frac{1 - 2x^2}{1 - x^2} - \alpha \frac{1 - nx^2}{1 - x^2}.$$

Combining this with the assumption $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$, (5), and $\alpha \leq 1 - \frac{1}{r} - \varepsilon$, we get

$$\begin{aligned}
\frac{\lambda_\alpha(G - w)}{n - 2} &\geq \frac{\lambda_\alpha(G)}{n - 1} \left(1 + \frac{1}{n - 2}\right) \frac{1 - 2x^2}{1 - x^2} - \alpha \frac{1 - nx^2}{(n - 2)(1 - x^2)} \\
&= \frac{\lambda_\alpha(G)}{n - 1} \left(1 + \left(1 - \alpha \frac{n - 1}{\lambda_\alpha(G)}\right) \frac{1 - nx^2}{(n - 2)(1 - x^2)}\right) \\
&\geq \frac{\lambda_\alpha(G)}{n - 1} \left(1 + \left(1 - \left(1 - \frac{1}{r} - \varepsilon\right) \frac{n - 1}{(1 - \frac{1}{r})n - \frac{r}{4n}}\right) \cdot \frac{1 - nx^2}{(n - 2)(1 - x^2)}\right) \\
&\geq \frac{\lambda_\alpha(G)}{n - 1} \left(1 + \frac{\varepsilon}{1 - \frac{1}{r}} \cdot \frac{1 - nx^2}{(n - 2)(1 - x^2)}\right) \\
&\geq \frac{\lambda_\alpha(G)}{n - 1} \left(1 + \frac{r\varepsilon^3}{(r - 1)(n - 1)}\right),
\end{aligned} \quad (9)$$

where the last inequality holds as $x^2 < \frac{1-\varepsilon^2}{n}$.

Then, it follows that

$$\begin{aligned}
\lambda_\alpha(G - w) &\geq \lambda_\alpha(G) \left(1 - \frac{1}{n - 1}\right) \left(1 + \frac{r\varepsilon^3}{(r - 1)(n - 1)}\right) \\
&\geq \lambda_\alpha(G) \left(1 - \frac{1 - \varepsilon^3}{n - 1}\right).
\end{aligned}$$

Next we prove (8). By (9), we obtain

$$\begin{aligned}
\frac{\lambda_\alpha(G-w)}{n-2} &\geq \frac{\lambda_\alpha(G)}{n-1} \left(1 + \frac{1-nx^2}{(n-2)(1-x^2)}\right) - \alpha \frac{1-nx^2}{(n-2)(1-x^2)} \\
&= \frac{\lambda_\alpha(G)}{n-1} + \left(\frac{\lambda_\alpha(G)}{n-1} - \alpha\right) \frac{1-nx^2}{(n-2)(1-x^2)} \\
&\geq \frac{\lambda_\alpha(G)}{n-1} + \left(\frac{(1-\frac{1}{r})(n-1)}{n-1} - \left(1 - \frac{1}{r} - \varepsilon\right)\right) \frac{1-nx^2}{(n-2)(1-x^2)} \\
&= \frac{\lambda_\alpha(G)}{n-1} + \frac{\varepsilon(1-nx^2)}{(n-2)(1-x^2)} \\
&> \frac{\lambda_\alpha(G)}{n-1} + \frac{\varepsilon^3}{n-2},
\end{aligned} \tag{10}$$

where the second inequality holds as $\lambda_\alpha(G) \geq (1 - \frac{1}{r})(n-1)$ and $\alpha \leq 1 - \frac{1}{r} - \varepsilon$, and the last inequality holds as $x^2 < \frac{1-\varepsilon^2}{n}$.

For sufficiently large n , by (4), we have $\lambda_\alpha(\mathcal{G}'_{n-1}) \leq (\pi(\mathcal{F}) + \sigma)(n-1)$. Combining this with (10), Lemma 5.2 and the assumption $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$, we get

$$\begin{aligned}
\lambda_\alpha(G-w) &\geq \lambda_\alpha(G) \left(1 - \frac{1}{n-1}\right) + \varepsilon^3 \\
&\geq (\lambda_\alpha(\mathcal{G}'_{n-1}) + \pi(\mathcal{F}) - 5\sigma) \left(1 - \frac{1}{n-1}\right) + \varepsilon^3 \\
&\geq \lambda_\alpha(\mathcal{G}'_{n-1}) - 7\sigma + \varepsilon^3 \\
&> \lambda_\alpha(\mathcal{G}'_{n-1}),
\end{aligned}$$

where the last inequality holds as $\sigma < \frac{\varepsilon^3}{7}$. The proof is complete. \square

The following facts, proved by Zheng, Li, and Li [23], will be employed in our proof

Fact 1. If $0 < x < \frac{1}{2}$ and $0 < a < 1$, then $\ln(1-ax) + ax + x^2 > 0$.

Fact 2. If $x > 1$, then $\frac{1}{x} < \ln x - \ln(x-1)$ and $\frac{1}{x^2} < \frac{1}{x-1} - \frac{1}{x}$.

We are now ready to prove Theorem 5.1.

Proof of Theorem 5.1. We prove by contradiction. Suppose to the contrary that there exists an \mathcal{F} -free graph G with order n such that $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$ and $G \notin \mathcal{G}'_n$. Let N be a sufficiently large integer such that Lemma 5.4 and Lemma 5.5 hold for $n > N$. Moreover, according to (5), we assume $\lambda_\alpha(\mathcal{G}'_n) \geq (1-\varepsilon)\pi(\mathcal{F})n$ for $n > N$. Let $n_0 = \left(\frac{Ne}{(1-\varepsilon)\pi(\mathcal{F})}\right)^{\frac{1}{\varepsilon^3}}$. Note that $n_0 > N$. Let $\mathbf{x}^{(n)} = (x_1^{(n)}, \dots, x_n^{(n)})$ be a non-negative unit eigenvector of $A_\alpha(G)$ corresponding to $\lambda_\alpha(G)$. Suppose $w^{(n)} \in V(G)$ such that $x_{w^{(n)}} = \min \{x_1^{(n)}, \dots, x_n^{(n)}\}$. Recall that $\lambda_\alpha(G) \geq \lambda_\alpha(\mathcal{G}'_n)$ and $\delta(G) \leq (\pi(\mathcal{F}) - \varepsilon)n$. Then, by Lemma 5.4, $x_{w^{(n)}}^2 < \frac{1-\varepsilon^2}{n}$. For $n \geq n_0$, denote $G_n = G$ and $G_{n-1} = G_n - w^{(n)}$. Then, it follows from Lemma 5.5

that

$$\lambda_\alpha(G_{n-1}) \geq \lambda_\alpha(G_n) \left(1 - \frac{1 - \varepsilon^3}{n - 1}\right)$$

and

$$\lambda_\alpha(G_{n-1}) > \lambda_\alpha(\mathcal{G}'_{n-1}).$$

Since $\lambda_\alpha(G_{n-1}) > \lambda_\alpha(\mathcal{G}'_{n-1})$, $G_{n-1} \notin \mathcal{G}'_{n-1}$. So $\delta(G_{n-1}) \leq (\pi(\mathcal{F}) - \varepsilon)(n - 1)$. Let $\mathbf{x}^{(n-1)} = (x_1^{(n-1)}, \dots, x_{n-1}^{(n-1)})$ be a non-negative unit eigenvector of $A_\alpha(G_{n-1})$ corresponding to $\lambda_\alpha(G_{n-1})$. Suppose $w^{(n-1)} \in V(G_{n-1})$ such that $x_{w^{(n-1)}} = \min \{x_1^{(n-1)}, \dots, x_{n-1}^{(n-1)}\}$. Denote $G_{n-2} = G_{n-1} - w^{(n-1)}$. Continue this operation, we can obtain a sequence of graphs G_n, G_{n-1}, \dots , which satisfies

$$\lambda_\alpha(G_{i-1}) \geq \lambda_\alpha(G_i) \left(1 - \frac{1 - \varepsilon^3}{i - 1}\right)$$

and

$$\lambda_\alpha(G_{i-1}) > \lambda_\alpha(\mathcal{G}'_{i-1})$$

for each $n \geq i > N$.

Then, for $i = N + 1$, we have

$$\begin{aligned} \lambda_\alpha(G_N) &\geq \lambda_\alpha(G_{N+1}) \left(1 - \frac{1 - \varepsilon^3}{N}\right) \\ &\geq \lambda_\alpha(G_n) \prod_{i=N+1}^n \left(1 - \frac{1 - \varepsilon^3}{i - 1}\right) \\ &\geq \lambda_\alpha(G_n) \exp \left(- \sum_{i=N+1}^n \left(\frac{1 - \varepsilon^3}{i - 1} + \left(\frac{1}{i - 1} \right)^2 \right) \right) \\ &\geq \lambda_\alpha(G_n) \exp \left(-(1 - \varepsilon^3) \ln \frac{n}{N - 1} - 1 \right) \\ &\geq (1 - \varepsilon) \pi(\mathcal{F}) n \left(\frac{n}{N - 1} \right)^{-(1 - \varepsilon^3)} e^{-1} \\ &\geq (1 - \varepsilon) \pi(\mathcal{F}) n^{\varepsilon^3} e^{-1} \\ &\geq (1 - \varepsilon) \pi(\mathcal{F}) n_0^{\varepsilon^3} e^{-1} = N, \end{aligned}$$

where the third inequality holds as Fact 1 and the fourth inequality holds as Fact 2. This contradicts the fact that $\lambda_\alpha(G_N) \leq N - 1$. The proof is complete. \square

5.2 Proof of Theorem 2.3

Andrásfai, Erdős, and Sós [1] showed that K_{r+1} is degree-stable with respect to the family of r -partite graphs. Erdős and Simonovits [7] extended the result to all color-critical graphs.

Lemma 5.6 (Erdős and Simonovits [7]). *Let F be a color-critical graph with $\chi(F) = r + 1 \geq 3$. There is n_0 such that if G is an F -free graph on $n \geq n_0$ vertices with $\delta(G) > \frac{3r-4}{3r-1}n$, then G is r -partite.*

Next, we derive an upper bound for $\lambda_\alpha(T_{n,r})$. To this end, we first state the following lemma.

Lemma 5.7. *Let \mathcal{G} be a hereditary and multiplicative graph family, and let $r \geq 2$. If for any $0 \leq \alpha \leq 1 - \frac{1}{r}$, the inequality $\lambda_\alpha(\mathcal{G}_n) > (1 - \frac{1}{r})n - (1 - \frac{1}{r})$ holds, then*

$$\lambda_\alpha(G) \leq \pi_\alpha(\mathcal{G})n$$

for every $G \in \mathcal{G}_n$.

Proof. Let $H \in \mathcal{G}_n$ satisfy $\lambda_\alpha(H) = \lambda_\alpha(\mathcal{G}_n)$. Since \mathcal{G} is multiplicative, $H^p \in \mathcal{G}_{pn}$ for all $p \geq 1$. Using the quotient matrix method, it can be verified that $\lambda_\alpha(H^p) = p\lambda_\alpha(H)$. Consequently,

$$\frac{\lambda_\alpha(\mathcal{G}_n)}{n} = \frac{\lambda_\alpha(H)}{n} = \frac{\lambda_\alpha(H^p)}{pn} \leq \frac{\lambda_\alpha(\mathcal{G}_{pn})}{pn}.$$

By Lemma 3.4 and the assumption $\lambda_\alpha(\mathcal{G}_n) > (1 - \frac{1}{r})n - (1 - \frac{1}{r})$, we have $\lim_{p \rightarrow \infty} \frac{\lambda_\alpha(\mathcal{G}_{pn})}{pn} = \pi_\alpha(\mathcal{G})$. For any $G \in \mathcal{G}_n$, we thus have

$$\frac{\lambda_\alpha(G)}{n} \leq \frac{\lambda_\alpha(\mathcal{G}_n)}{n} \leq \pi_\alpha(\mathcal{G}),$$

which implies that $\lambda_\alpha(G) \leq \pi_\alpha(\mathcal{G})n$. □

Lemma 5.8. *For $r \geq 2$ and $0 \leq \alpha \leq 1 - \frac{1}{r}$, we have $\lambda_\alpha(T_{n,r}) \leq (1 - \frac{1}{r})n$.*

Proof. Let \mathcal{G} denote the collection of all K_{r+1} -free graphs. It is straightforward that \mathcal{G} is both hereditary and multiplicative. Since $T_{n,r} \in \mathcal{G}_n$, $\lambda_\alpha(\mathcal{G}_n) \geq (1 - \frac{1}{r})n - \frac{r}{4n}$. By Theorem 2.1, $\pi_\alpha(\mathcal{G}) = 1 - \frac{1}{r}$, and thus Lemma 5.7 yields $\lambda_\alpha(T_{n,r}) \leq (1 - \frac{1}{r})n$. □

We are now ready to give the proof of Theorem 2.3.

Proof of Theorem 2.3. Let F be a color-critical graph with $\chi(F) = r + 1 \geq 3$, and let G be an arbitrary F -free n -vertex graph. Recall that $\text{ex}(n, F) = e(T_{n,r}) = (1 - \frac{1}{r})\frac{n^2}{2} + O(1)$ and $\pi(F) = 1 - \frac{1}{r}$. Let $\varepsilon > 0$ and $\sigma < \frac{\varepsilon^3}{7}$ be two sufficiently small constants. For sufficiently large n , we have

$$|\text{ex}(n, F) - \text{ex}(n-1, F) - \pi(F)n| = O(1) \leq \sigma n.$$

Let \mathcal{G}'_n be the set of all F -free graphs on n vertices with minimum degree more than $(\pi(F) - \varepsilon)n$. Note that $1 - \frac{1}{r} - \varepsilon > \frac{3r-4}{3r-1}$ as ε is sufficiently small. Then, for sufficiently large n , every graph in \mathcal{G}'_n is an r -partite graph by Lemma 5.6. Clearly, $T_{n,r} \in \mathcal{G}'_n$, which implies that $\lambda_\alpha(\mathcal{G}'_n) = \lambda_\alpha(T_{n,r})$ by Theorem 1.7. Combining with (5) and Lemma 5.8, we deduce that $\lambda_\alpha(\mathcal{G}'_n) = \lambda_\alpha(T_{n,r}) = (1 - \frac{1}{r})n + o(1)$. Hence,

$$\left| \lambda_\alpha(\mathcal{G}'_n) - \frac{2\text{ex}(n, F)}{n} \right| = o(1) \leq \sigma.$$

Therefore, by Theorem 5.1, $\lambda_\alpha(G) \leq \lambda_\alpha(\mathcal{G}'_n)$ with equality if and only if $G = T_{n,r}$. This completes the proof. □
