

On Graded Deformations of The universal Enveloping Algebra of a Color Lie Algebra

Toukaiddine Petit*

Abstract

Let \mathfrak{g} be a Color Lie Algebra and $\mathcal{U}(\mathfrak{g})$ its the universal Enveloping Algebra. We define the notion of graded deformations and we give explicit graded deformations of the universal Enveloping Algebra of \mathfrak{g} .

1 Preliminaries

Throughout this paper groups are assumed to be abelian and \mathbb{K} is a field of characteristic zero. We recall some notation for graded algebras and graded modules [6], and some facts on color Lie algebras from [7, 8, 9, 10].

1.1 Color Lie algebras

The concept of color Lie algebras is related to an abelian group G and an anti-symmetric bicharacter $\varepsilon : G \times G \rightarrow \mathbb{K}^\times$, i.e.,

$$\varepsilon(g, h) \varepsilon(h, g) = 1, \quad (1.1)$$

$$\varepsilon(g, hk) = \varepsilon(g, h) \varepsilon(g, k), \quad (1.2)$$

$$\varepsilon(gh, k) = \varepsilon(g, k) \varepsilon(h, k), \quad (1.3)$$

where $g, h, k \in G$ and \mathbb{K}^\times is the multiplicative group of the units in \mathbb{K} .

A G -graded space $L = \bigoplus_{g \in G} L_g$ is said to be a G -graded ε -Lie algebra (or simply, color Lie algebra), if it is endowed with a bilinear bracket $[-, -]$ satisfying the following conditions

$$[L_g, L_h] \subseteq L_{gh}, \quad (1.4)$$

$$[a, b] = -\varepsilon(|a|, |b|) [b, a], \quad (1.5)$$

$$\varepsilon(|c|, |a|) [a, [b, c]] + \varepsilon(|a|, |b|) [b, [c, a]] + \varepsilon(|b|, |c|) [c, [a, b]] = 0, \quad (1.6)$$

where $g, h \in G$, and $a, b, c \in L$ are homogeneous elements.

For example, a super Lie algebra is exactly a \mathbb{Z}_2 -graded ε -Lie algebra where

$$\varepsilon(i, j) = (-1)^{ij}, \quad \forall \quad i, j \in \mathbb{Z}_2. \quad (1.7)$$

1.2 Graded Cohomology of Cartan Eilenberg of Color Lie Algebra

A vector space M is G -graded if there is a family of subspaces $(M_g)_{g \in G}$ such that $M = \bigoplus M_g$. Let M, N two graded vector spaces. A linear map from M to N is of homogeneous degree α if $f(M_\beta) \subset N_{\alpha+\beta}$ for β . Denote by $Hom_\alpha(M, N)$ the set of linear maps of homogeneous degree α . The graded vector space $Hom_{gr}(M, N) = \bigoplus Hom_\alpha(M, N)$ equipped by the bracket defined by $[f, g] = f \circ g - \varepsilon(f, g)g \circ f$ is a color Lie algebra. Let L be a color Lie algebra. A graded representation of L in M is a linear map of degree zero, $\rho : L \rightarrow Hom_{gr}(M, M)$ satisfying $[\rho(f), \rho(g)] = \rho([f, g])$. One said that M is a graded L module. In general a n linear map $f : L \times \cdots \times L \rightarrow M$ is of homogeneous degree α if $f(X_{\alpha_1}, \dots, X_{\alpha_n})$ is homogeneous of degree $\alpha + \alpha_1 + \cdots + \alpha_n$. Denote by $Hom_\alpha^n(L \times \cdots \times L, N)$ the set of linear maps of homogeneous degree α . The $Hom_{gr}^n(L \times \cdots \times L, N) = \bigoplus Hom_\alpha^n(L \times \cdots \times L, N)$ is a G graded vector space. It admits a G graded L module given by $\rho(X)(f)(X_{\alpha_1}, \dots, X_{\alpha_n}) =$

$$\rho(X)(f(X_{\alpha_1}, \dots, X_{\alpha_n})) - \sum_{i=1}^n \varepsilon(\alpha, \gamma + \alpha_1 + \cdots + \alpha_{i-1}) f(X_{\alpha_1}, \dots, [X, X_{\alpha_i}], X_{\alpha_n}) \quad (1.8)$$

An element of f of homogeneous of degree γ is called ε skew symmetric if

$$f(X_{\alpha_1}, \dots, X_{\alpha_i}, \dots, X_{\alpha_j}, X_{\alpha_n}) = -\varepsilon(\alpha_i, \alpha_j) f(X_{\alpha_1}, \dots, X_{\alpha_j}, \dots, X_{\alpha_i}, X_{\alpha_n}) \quad (1.9)$$

for $i < j$ We set

$C^0(L, N) = N$, $C_{gr}^1(L, N) = Hom_{gr}(L, N)$, $C_{gr}^n(L, N)$ the set of elements which are ε skew symmetric of $Hom_{gr}^n(L \times \cdots \times L, N)$. for $n > 1$. The graded space called n graded cochains. The linear coboundary operator

$$d^n : C_{gr}^n(L, N) \rightarrow C_{gr}^{n+1}(L, N) \quad (1.10)$$

defined by for $n > 1$

$$\delta^n(f)(x_1, \dots, x_{n+1}) \quad (1.11)$$

$$= \sum_{i=1}^{n+1} (-1)^{i+1} \varepsilon(\gamma, \alpha_i) \varepsilon_i x_i \cdot f(x_1, \dots, \hat{x}_i, \dots, x_{n+1}) \quad (1.12)$$

$$+ \sum_{1 \leq i < j \leq n+1} (-1)^{i+j} \varepsilon(\gamma, \alpha_i) \varepsilon(\gamma, \alpha_j) \varepsilon_i \varepsilon_j f([x_i, x_j], x_1, \dots, \hat{x}_i, \dots, \hat{x}_j, \dots, x_{n+1}), \quad (1.13)$$

for all $f \in C_{gr}^n(L, N)_\gamma$, with $\varepsilon_i = \prod_{h=1}^{i-1} \varepsilon(|x_h|, |x_i|)$ $i \geq 2$, $\varepsilon_1 = 1$ and the sign \wedge indicates that the element below it must be omitted. We have $\delta^{n+1} \circ \delta^n = 0$, [3, 9]

1.3 Graded Deformations of color Lie Algebras

The field K admits a G graded by setting $K_e = K$ and $K_\gamma = 0$ if $\gamma \neq 0$. Then the ring of series with coefficient in K , $K[[t]]$ is G graded by extension. Let E

be a G -graded vector space. Then the $K[[t]]$ module $E[[t]]$ is G -graded module. Let L be a Color Lie algebra, The $K[[t]]$ module $L[[t]]$ is a Color Lie algebra by extension.

Definition 1 Let L be a Color Lie algebra over K with multiplication ϕ_0 .

1. A G graded deformation of the Color Lie algebra $(L[[t]], \phi_0)$ (of degree zero) is a G graded $K[[t]]$ -module $L[[t]]$ equipped of a Color multiplication $\phi = \sum_t \phi_n t^n$ with $\phi_n \in C^2(L, L)_e$
2. Two graded deformations $(L[[t]], \phi_1)$ and $(L[[t]], \phi_2)$ of $(L[[t]], \phi_0)$ are said equivalent if they are isomorphic i.e. there is a graded automorphism $f = id + t f_1 + t^2 f_2 + \dots + t^n f_n + \dots$ with $f \in C^1(L, L)_e$ such that $\phi_2 = f^{-1} \circ \phi_1 \circ f \times f$.
3. A graded deformation $(L[[t]], \phi)$ is said trivial if all graded deformation is equivalent to $(L[[t]], \phi_0)$.
4. L is called graded rigid if all graded deformation of $(L[[t]], \phi_0)$ is trivial.

Theorem 1 Let L be a color Lie algebra. If the second graded cohomology $H^2(L, L)_e$ is equal to zero, then L is graded rigid.

1.4 Graded Hochschild cohomology

Let G be an abelian group with identity element e . We will write G as an multiplicative group.

An associative algebra A with unit 1_A , is said to be G -graded, if there is a family $\{A_g | g \in G\}$ of subspaces of A such that $A = \bigoplus_{g \in G} A_g$ with $1_A \in A_e$ and $A_g A_h \subseteq A_{gh}$, for all $g, h \in G$. Any element $a \in A_g$ is called homogeneous of degree g , and we write $|a| = g$.

A (left) graded A -module M is a left A -module with an decomposition $M = \bigoplus_{g \in G} M_g$ such that $A_g.M_h \subseteq M_{gh}$. Let M and N be graded A -modules. Define

$$\text{Hom}_{A\text{-gr}}(M, N) = \{f \in \text{Hom}_A(M, N) | f(M_g) \subseteq N_g, \quad \forall g \in G\}. \quad (1.14)$$

Let us recall the notion of graded Hochschild cohomology of a graded algebra A . A graded A -bimodule is a A -bimodule $M = \bigoplus_{g \in G} M_g$ such that $A_g.M_h.A_k \subseteq M_{ghk}$. The Hochschild graded cochain complex of A is

$$A \rightarrow \text{Hom}_{gr}(A, A) \rightarrow \text{Hom}_{gr}(A \times A, A) \rightarrow \dots \rightarrow \text{Hom}_{gr}(A \times \dots \times A, A) \rightarrow \dots$$

whose differential is given by

$$d(f)(a_0, a_1, \dots, a_p) = a_0 f(a_1, \dots, a_p) - \sum_{i=0}^{p-1} (-1)^i f(a_0, a_1, \dots, a_i a_{i+1}, \dots, a_p) + (-1)^p f(a_0, \dots, a_{p-1}) a_p \quad (1.15)$$

1.5 Enveloping Algebra of a Color Lie algebra

Let L be a color Lie algebra as above and $T(L)$ the tensor algebra of the underlying G -graded vector space L . It is well-known that $T(L)$ has a natural $\mathbb{Z} \times G$ -grading which is fixed by the condition that the degree of a tensor $a_1 \otimes \dots \otimes a_n$ with $a_i \in L_{g_i}$, $g_i \in G$, $1 \leq i \leq n$, is equal to $(n, g_1 \cdots g_n)$. The subspace of $T(L)$ spanned by homogeneous tensors of order $\leq n$ will be denoted by $T^n(L)$. Let $J(L)$ be the G -graded two-sided ideal of $T(L)$ which is generated by

$$a \otimes b - \varepsilon(|a|, |b|) b \otimes a - [a, b] \quad (1.16)$$

with homogeneous $a, b \in L$. The quotient algebra $U(L) := T(L)/J(L)$ is called the universal enveloping algebra of the color Lie algebra L . The \mathbb{K} -algebra $U(L)$ is a G -graded algebra and has a positive filtration by putting $U^n(L)$ equal to the canonical image of $T^n(L)$ in $U(L)$.

$I(L)$ be the G -graded two-sided ideal of $T(L)$ which is generated by

$$a \otimes b - \varepsilon(|a|, |b|) b \otimes a \quad (1.17)$$

with homogeneous $a, b \in L$. The quotient algebra $S(L) := T(L)/I(L)$ is called the universal symmetric algebra of the color Lie algebra L .

The canonical map $\mathbf{i} : L \rightarrow U(L)$ is a G -graded homomorphism and satisfies

$$\mathbf{i}(a) \mathbf{i}(b) - \varepsilon(|a|, |b|) \mathbf{i}(b) \mathbf{i}(a) = \mathbf{i}([a, b]). \quad (1.18)$$

The \mathbb{Z} -graded algebra $G(L)$ associated with the filtered algebra $U(L)$ is defined by letting $G^n(L)$ be the vector space $U^n(L)/U^{n-1}(L)$ and $G(L)$ the space $\bigoplus_{n \in \mathbb{N}} G^n(L)$ (note $U^{-1}(L) := \{0\}$). Consequently, $G(L)$ is a $\mathbb{Z} \times G$ -graded algebra. The well-known generalized Poincaré-Birkhoff-Witt theorem, states that the canonical homomorphism $\mathbf{i} : L \rightarrow U(L)$ is an injective G -graded homomorphism; moreover, if $\{x_i\}_I$ is a homogeneous basis of L , where the index set I well-ordered. Set $y_{k_j} := \mathbf{i}(x_{k_j})$, then the set of ordered monomials $y_{k_1} \cdots y_{k_n}$ is a basis of $U(L)$, where $k_j \leq k_{j+1}$ and $k_j < k_{j+1}$ if $\varepsilon(g_j, g_j) \neq 1$ with $x_{k_j} \in L_{g_j}$ for all $1 \leq j \leq n, n \in \mathbb{N}$. In case L is finite-dimensional $U(L)$ is a two-sided (graded) Noetherian algebra. The Poincaré-Birkhoff-Witt theorem shows that there is a canonical graded algebra isomorphism from $S(L)$ to $G(L)$.

2 Graded Deformations of Enveloping algebra of A Color Lie Algebra

2.1 Graded Deformation by the Lie Color algebra

Theorem 2 *Let \mathfrak{g} be a Color Lie Algebra and $\mathcal{U}(\mathfrak{g})$ its the universal Enveloping Algebra. If $(\mathfrak{g}[[t]], \mu_t)$ is a non trivial graded deformation of \mathfrak{g} , then it is uniquely extended to a graded deformation of the associative algebra $\mathcal{U}(\mathfrak{g})$.*

Proof: Let be a $(\mathfrak{g}[[t]], \mu_t)$ graded deformation of \mathfrak{g} which is not non trivial with $\mu_t = \sum_{n=0}^{\infty} \mu_n t^n$ such that the class of μ_1 is not null in $\mathbf{H}^2(\mathfrak{g}, \mathfrak{g})_e$. Since \mathfrak{g} is finite dimension, then the $\mathbb{K}[[t]]$ -module $\mathfrak{g}[[t]]$ is graded isomorphic to the free module $\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]]$. Let e_1, \dots, e_n be a homogeneous basis of \mathfrak{g} , y_1, \dots, y_n the vector of images of the basis in $\mathcal{U}(\mathfrak{g})g$ and y'_1, \dots, y'_n the vector of images of the basis in $\mathcal{U}(\mathfrak{g}[[t]])$. Ones denotes

• the multiplication of $\mathcal{U}(\mathfrak{g}[[t]])$. For all increase finite sequence $I = (i_1, \dots, i_k)$ of indices in $\{1, \dots, n\}$ set $y_I := y_{i_1} \cdots y_{i_k}$ in $\mathcal{U}\mathfrak{g}$ and $y'_I := y'_{i_1} \bullet \cdots \bullet y'_{i_k}$ in $\mathcal{U}(\mathfrak{g}[[t]])$. The theorem of Poincaré-Birkhoff-Witt (is valid in the situation of Color Lie algebra which is a free module over a commutative ring, the y_I forme a basis of $\mathcal{U}(\mathfrak{g})$ over \mathbb{K} and y'_I forme a basi of $\mathcal{U}(\mathfrak{g}[[t]])$ over $\mathbb{K}[[t]]$). We see the map $\Phi : \mathcal{U}\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]] \rightarrow \mathcal{U}(\mathfrak{g}[[t]])$ defined by $\Phi(y_I) := y'_I$ is graded isomorphic of $\mathbb{K}[[t]]$ -modules. Let $\pi_t : \mathcal{U}\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]] \times \mathcal{U}\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]] \rightarrow \mathcal{U}(\mathfrak{g}) \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ the multiplication $\mathcal{U}(\mathfrak{g}) \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ induces by \bullet et Φ , i.e., $\pi_t(a, b) := \Phi^{-1}(\Phi(a) \bullet \Phi(b))$. The restriction of π_t of elements of $\mathcal{U}(\mathfrak{g}) \times \mathcal{U}(\mathfrak{g})$ defined an application \mathbb{K} -bilinear $\mathcal{U}(\mathfrak{g}) \times \mathcal{U}(\mathfrak{g}) \rightarrow \mathcal{U}(\mathfrak{g}) \otimes_{\mathbb{K}} \mathbb{K}[[t]] \subset \mathcal{U}(\mathfrak{g}[[t]])$ that denote again by π_t , i.e, $\pi_t(u, v) = \sum_{n=0}^{\infty} t^n \pi_n(u, v)$ all elements $u, v \in \mathcal{U}(\mathfrak{g})$ où $\pi_n \in \mathbf{Hom}_{gr}(\mathcal{U}(\mathfrak{g}) \otimes \mathcal{U}(\mathfrak{g}), \mathcal{U}(\mathfrak{g}))$. L'associativity of π_t on three elements $u, v, w \in \mathcal{U}(\mathfrak{g})$ imply the equations $\sum_{s=0}^r \left(\pi_s(\pi_{r-s}(u, v), w) - \pi_s(u, \pi_{r-s}(v, w)) \right) = 0$ all $r \in \mathbb{N}$. Then, π_t defines a bilinear multiplication $\mathbb{K}[[t]]$ -associative on the $\mathbb{K}[[t]]$ -module $\mathcal{U}(\mathfrak{g})[[t]]$ (which is containing $\mathcal{U}(\mathfrak{g}) \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ as sub-module dense by the topology t -adic) of usually manner

$$\pi_t \left(\sum_s t^s u_s, \sum_{s'=0}^{\infty} t^{s'} v_{s'} \right) := \sum_{r=0}^{\infty} t^r \sum_{\substack{s, s', s'' \geq 0 \\ s+s'+s''=r}} \pi_{s''}(u_s, v_{s'})$$

In particular, the map π_0 defines the associative multiplication on the vector space $\mathcal{U}(\mathfrak{g})$, and $(\mathcal{U}(\mathfrak{g})[[t]], \pi_t)$ is a graded associative deformation of $(\mathcal{U}(\mathfrak{g}), \pi_0)$. All finite increasing sequence I, J we have $\pi_0(y_I, y_J) = \Phi^{-1}(y'_I \bullet y'_J)|_{t=0}$: by 'well ordonning' the product $y'_I \bullet y'_J$ we obtain of linear combinaisons of y'_K où the increasing finite sequence K is length less than or equal to the sum of the length of I and J which the coefficients do not contain only the structure constants of bracket μ_0 of the Color Lie algebra \mathfrak{g} since $t = 0$. Then π_0 is equal the multiplication of the enveloping algebra $\mathcal{U}(\mathfrak{g})$ et $(\mathcal{U}(\mathfrak{g})[[t]], \pi_t)$ is a graded associative deformation of the enveloping algebra $\mathcal{U}(\mathfrak{g})$

It follows that π_1 is a graded 2-cocycle of Hochschild of $\mathcal{U}(\mathfrak{g})$, and the restriction of π_1 sur $X, Y \in \mathfrak{g}$ verifies

$$\mu_1(X, Y) = \pi_1(X, Y) - \varepsilon(X, Y)\pi_1(Y, X) \quad \forall X, Y \in \mathfrak{g}. \quad (2.1)$$

since the Color Lie algebra $(\mathfrak{g}[[t]], \mu_t)$ is a Color Lie sub-algebra of $\mathcal{U}(\mathfrak{g}[[t]])$ which can be considered as a associative subalgebra of $(\mathcal{U}(\mathfrak{g})[[t]], \pi_t)$. We assume that this deformation of $\mathcal{U}(\mathfrak{g})$ is trivial, implies that there is a formalle graded isomorphism $\varphi_t = \sum_{r=0}^{\infty} \varphi_r t^r$, with $\varphi_0 = Id_{\mathcal{U}(\mathfrak{g})}$ et $\varphi_n \in \mathbf{Hom}(\mathcal{U}(\mathfrak{g}), \mathcal{U}(\mathfrak{g}))_e$ such that

$$\varphi_t(\pi_t(u, v)) = \pi_t(\varphi_t(u), \varphi_t(v)), \quad \forall u, v \in \mathcal{U}(\mathfrak{g}),$$

ce qui est équivalent à

$$\sum_{r=0}^{\infty} t^r \sum_{\substack{a, b \geq 0 \\ a+b=r}} \varphi_a(\pi_b(u, v)) = \sum_{r=0}^{\infty} t^r \sum_{\substack{a, b, c \geq 0 \\ a+b+c=r}} \pi_a(\varphi_b(u), \varphi_c(v)) \quad \forall u, v \in \mathcal{U}(\mathfrak{g}). \quad (2.2)$$

For $r = 1$, this relation gives

$$\pi_1(u, v) = (\delta_H \varphi_1)(u, v) \quad \forall u, v \in \mathcal{U}(\mathfrak{g}) \quad (2.3)$$

where δ_H is the differential operator of Hochschild associated with the multiplication π_0 of the enveloping algebra.

Then the formulas gives

$$\mu_1(X, Y) = (\delta_H \varphi_1)(X, Y) - \varepsilon(X, Y)(\delta_H \varphi_1)(Y, X)$$

$$\begin{aligned}
&= X\varphi_1(Y) - \varphi(XY) + \varphi(X)Y - \varepsilon(X, Y)(-Y\varphi_1(X) + \varphi(YX) - \varphi(Y)X) \\
&= (\delta_{CE}\varphi_1)(X, Y) \quad \forall X, Y \in \mathfrak{g}
\end{aligned} \tag{2.4}$$

where δ_{CE} is the graded differential operator of Chevalley-Eilenberg

Then μ_1 est is coboundary of Graded Chevalley-Eilenberg and its class is null in $H^2(\mathfrak{g}, \mathfrak{g})_e$, gives a contradiction. \square

Corollary 1 *Let \mathfrak{g} be a Color Lie Algebra and $\mathcal{U}(\mathfrak{g})$ its the universal Enveloping Algebra. If the associative algebra $\mathcal{U}(\mathfrak{g})$ is graded rigid, then the Color Lie algebra \mathfrak{g} is graded rigid.*

2.2 Deformation by central extension

Let \mathfrak{g} be a Color Lie Algebra and ω a two graded cocycle with value in K such that its class in non null in $H^2(\mathfrak{g}, K)_e$. The central extension of \mathfrak{g} by c is defined by $\mathfrak{g}_\omega = \mathfrak{g} \oplus K$ and $[X + \alpha c, Y + \beta c] = [X, Y] + \omega(X, Y)c$

Theorem 3 *Let \mathfrak{g} be a Color Lie Algebra and $\mathcal{U}_\mathfrak{g}$ its the universal Enveloping Algebra. If the second graded cohomology with in K , $H(\mathfrak{g}, K)_e$ is different from zero, then the Enveloping algebra $\mathcal{U}_\omega \mathfrak{g}$ admits a non trivial graded deformation.*

Proof: Let $\omega \in \mathbf{Z}_{CE}^2(\mathfrak{g}, \mathbb{K})_e$ be a graded 2-cocycle of non null class and $\mathfrak{g}_{t\omega}[[t]]$ the one dimension central extension of the Color lie algebra $\mathfrak{g}[[t]] = \mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ over $K = \mathbb{K}[[t]]$ associated with $t\omega$. In the enveloping algebra $\mathcal{U}(\mathfrak{g}_{t\omega}[[t]])$ of $\mathfrak{g}_{t\omega}[[t]]$ we denote the multiplication by \bullet and we consider the bilateral ideal $\mathcal{I} := (1 - c') \bullet \mathcal{U}(\mathfrak{g}_{t\omega}[[t]]) = \mathcal{U}(\mathfrak{g}_{t\omega}[[t]]) \bullet (1 - c')$ (where c' is the image of c in $\mathcal{U}(\mathfrak{g}_{t\omega}[[t]])$) and the quotient algebra $\mathcal{U}_{t\omega} \mathfrak{g} := \mathcal{U}(\mathfrak{g}_{t\omega}[[t]])/\mathcal{I}$. Let e_1, \dots, e_n a homogenous basis of \mathfrak{g} over \mathbb{K} . Then c, e_1, \dots, e_n is a homogenous basis of $\mathfrak{g}_{t\omega}[[t]]$ sur $\mathbb{K}[[t]]$. Let y_1, \dots, y_n the images of basis vecteurs in $\mathcal{U}_\mathfrak{g}$ et c', y'_1, \dots, y'_n the images of basis vecteurs in $\mathcal{U}(\mathfrak{g}_{t\omega}[[t]])$. For all finite increasing sequence $I = (i_1, \dots, i_k)$ of indices in $\{1, \dots, n\}$ set $y_I := y_{i_1} \cdots y_{i_k}$ in $\mathcal{U}_\mathfrak{g}$ and $y'_I := y'_{i_1} \cdots y'_{i_k}$ in $\mathcal{U}(\mathfrak{g}_{t\omega}[[t]])$. The theorem of Poincaré-Birkhoff-Witt the y_I form a basis of $\mathcal{U}_\mathfrak{g}$ over \mathbb{K} , and the $c'^{\bullet i_0} \bullet y'_I$ (où $i_0 \in \mathbb{N}$ et $c'^{\bullet i_0} := 1$) form a basis of $\mathcal{U}_{t\omega} \mathfrak{g}[[t]]$ over $\mathbb{K}[[t]]$. In the quotient algebra $\mathcal{U}_{t\omega} \mathfrak{g}$, we see that $c'^{\bullet i_0}$ can be identified to 1. By denoting the multiplication in $\mathcal{U}_{t\omega} \mathfrak{g}$ by \cdot and the images of y'_1, \dots, y'_n by the canonical projection by y''_1, \dots, y''_n , we see for all y'_I is sending to $y''_I := y''_{i_1} \cdots y''_{i_n}$. It follows that all the elements y''_I forme a basis of the quotient algebra $\mathcal{U}_{t\omega} \mathfrak{g}$. As in the demonstration of the pervious theorem, the map $\Phi : \mathcal{U}_\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]] \rightarrow \mathcal{U}_{t\omega} \mathfrak{g}$ given by $y_I \mapsto y''_I$ defines an isomorphism of free $\mathbb{K}[[t]]$ -modules. In the similarly manner as the precedent demonstration we show the multiplication induced over $\mathcal{U}_\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ by the multiplication \cdot of $\mathcal{U}_{t\omega} \mathfrak{g}$ and Φ défines a suite of maps $\pi_t = \sum_{r=0}^{\infty} \pi_r t^r$, où $\pi_r \in \mathbf{Hom}(\mathcal{U}_\mathfrak{g} \otimes \mathcal{U}_\mathfrak{g}, \mathcal{U}_\mathfrak{g})$ with the following property: (1.) π_t defines a graded associative deformation $(\mathcal{U}_\mathfrak{g}, \pi_0)$, i.e, a $\mathbb{K}[[t]]$ -bilinear multiplication over the graded $\mathbb{K}[[t]]$ -module $\mathcal{U}_\mathfrak{g}[[t]]$ (wich containing the $\mathbb{K}[[t]]$ -module $\mathcal{U}_\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]]$ as sub-espace dense for the topology t -adic), et (2.) π_0 is usually multiplication of the enveloping algebra $\mathcal{U}_\mathfrak{g}$ of \mathfrak{g} . It follows that π_1 is graded 2-cocycle of Hochschild of $\mathcal{U}_\mathfrak{g}$, and over all $X, Y \in \mathfrak{g} \subset \mathcal{U}_\mathfrak{g}$ we have the relation: $\omega(X, Y)1 = \pi_1(X, Y) - \varepsilon(X, Y)\pi_1(Y, X)$ since the Color Lie $\mathfrak{g}_{t\omega}[[t]]$ injecte in the quotient algebra $\mathcal{U}_{t\omega} \mathfrak{g}$, and so in $\mathcal{U}_\mathfrak{g} \otimes_{\mathbb{K}} \mathbb{K}[[t]] \subset \mathcal{U}_\mathfrak{g}[[t]]$.

We suppose that $\mathcal{U}_\mathfrak{g}$ is rigid, then in particular, the deformation π_t is trivial. Then there exists a graded 1-cocycle of Hochschild $\varphi_1 \in \mathbf{C}_H^1(\mathcal{U}_\mathfrak{g}, \mathcal{U}_\mathfrak{g})$ such that $\pi_1 = \delta_H(\varphi_1)$. It follows that $\forall X, Y \in \mathfrak{g}$:

$$\omega(X, Y)1 = \pi_1(X, Y) - \varepsilon(X, Y)\pi_1(Y, X)$$

$$= \delta_H(\varphi_1)(X, Y) - \varepsilon(X, Y)\delta_H(\varphi_1)(Y, X) = \delta_{CE}(\varphi_1)(X, Y).$$

Then ω is a graded cobord of Chevalley-Eilenberg and its class is null in $\mathbf{H}_{CE}^2(\mathfrak{g}, \mathbb{K})_e$, gives a contradiction. \square

2.3 Deformation by Poincaré-Birkhoff-Witt Theorem

Definition 2 Let χ be bi-character of G . Let $A = \oplus A_g$ a graded χ commutative associative algebra. A Color Poisson bracket is a Color Lie bracket satisfying the Leibniz property $\{a_\alpha, a_\beta a_\gamma\} = \{a_\alpha, a_\beta\}a_\gamma + \chi(\alpha, \beta)a_\beta\{a_\alpha, a_\gamma\}$. The algebra is called Color Poisson algebra.

The universal enveloping algebra $\mathcal{U}(\mathfrak{g})$ of the Color Lie algebra \mathfrak{g} equipped by the canonical filtration $(\mathcal{U}_n(\mathfrak{g}))_n$ satisfying $\mathcal{U}_n(\mathfrak{g})\mathcal{U}_m(\mathfrak{g}) \subset \mathcal{U}_{n+m}(\mathfrak{g})$. The graded associative algebra $gr(\mathcal{U}(\mathfrak{g})) = \oplus gr^n(\mathcal{U}(\mathfrak{g}))$ for this filtration, is defined by $gr^n(\mathcal{U}(\mathfrak{g})) = (\mathcal{U}_n(\mathfrak{g}))_n / (\mathcal{U}_n(\mathfrak{g}))_{n-1}$ with $(\mathcal{U}_n(\mathfrak{g}))_{-1} = 0$. Let $\pi_n : \mathcal{U}(\mathfrak{g})_n \rightarrow gr^n(\mathcal{U}(\mathfrak{g}))$ the canonical projection. The multiplication of the algebra $gr(\mathcal{U}(\mathfrak{g}))$ is defined by

$$\pi_n(u)\pi_m(v) := \pi_{n+m}(u.v)$$

with $u \in \mathcal{U}_n(\mathfrak{g})$ and $v \in \mathcal{U}_m(\mathfrak{g})$

Theorem 4 Let $(\mathfrak{g}, [\cdot, \cdot])$ be a Color Lie algebra, $\mathcal{U}(\mathfrak{g})$ its universal enveloping algebra. The associated graded algebra $gr(\mathcal{U}(\mathfrak{g}))$ is endowed of a Color Poisson bracket defined by

$$\{\hat{u}, \hat{v}\} := \pi_{n+m-1}(uv - \chi(u, v)vu)$$

with $u \in \mathcal{U}_n(\mathfrak{g})$ and $v \in \mathcal{U}_m(\mathfrak{g})$ and $\hat{u} = \pi_n(u)$, $\hat{v} = \pi_m(v)$

Proof: The bracket $\{\hat{u}, \hat{v}\}$ is independent of the choose of u and v . If $\hat{X}, \hat{Y} \in gr^1(\mathcal{U}(\mathfrak{g}))$, then the bracket satisfies the properties of Poisson Color. This bracket extends on $gr(\mathcal{U}(\mathfrak{g}))$ by bilinearity. The only property we need to verify is the Leibniz property. Let $\hat{X}, \hat{Y}, \hat{Z} \in gr^1(\mathcal{U}(\mathfrak{g}))$ and $X, Y, Z \in \mathcal{U}_1(\mathfrak{g})$ we have

$$\begin{aligned} \{\hat{X}, \hat{Y}\hat{Z}\} &= \pi_{1+2-1}(X(YZ) - \omega(X, YZ)(YZ)X) \\ &= \pi_2((XY - \omega(X, Y)YX)Z + \omega(X, Y)Y(XZ - \omega(X, Z)ZX)) \\ &= ((\pi_1(X)\pi_1(Y) - \omega(X, Y)\pi_1(Y)\pi_1(X))\pi_1(Z) + \omega(X, Y)\pi_1(Y)(\pi_1(X)\pi_1(Z) - \omega(X, Z)\pi_1(Z)\pi_1(X))) \\ &= \{\hat{X}, \hat{Y}\}\hat{Z} + \omega(\hat{X}, \hat{Y})\{\hat{X}, \hat{Z}\} \end{aligned}$$

Since $\mathcal{U}_1(\mathfrak{g}) = \mathbb{K} \oplus \mathfrak{g}$, we have $\omega(\hat{X}, \hat{Y}) = \omega(X, Y)$.

By Poincaré-Birkhoff-Witt Theorem, this bracket regives the Color Lie algebra of \mathfrak{g} . \square

Definition 3 Let $(A, m_0, \{\cdot, \cdot\})$ be a Color Poisson bracket. A graded star product of A is graded associative algebra deformation $(A[[t]], m_t)$ of A such that

$$m_1(a_\alpha, a_\beta) - \chi(\alpha, \beta)m_1(a_\beta, a_\alpha) = \{a_\alpha, a_\beta\}$$

for $a_\alpha \in A_\alpha, a_\beta \in A_\beta$

Theorem 5 *Poincaré-Birkhoff-Witt.* Let $(\mathfrak{g}, [\cdot, \cdot])$ be a Color Lie algebra, $\mathcal{U}(\mathfrak{g})$ its universal enveloping algebra and the associated graded algebra $gr(\mathcal{U}(\mathfrak{g}))$. The symmetrization map $\omega : gr(\mathcal{U}(\mathfrak{g})) \rightarrow \mathcal{U}(\mathfrak{g})$ is homogenous isomorphism of degree zero of \mathfrak{g} module, defined by

$$\omega_p(X_1 \bullet \cdots \bullet X_p) := \sum_{\sigma \in \mathcal{S}_p} \prod_{(i,j): \sigma(j) < \sigma(i)} \chi(i,j) X_{\sigma(1)} \circ \cdots \circ X_{\sigma(p)}$$

where \mathcal{S}_p is the group of permutation of order p and the product is extended over all $r, s \in 1, 2, \dots, n$ such that $r < s$ and $\pi^{-1}(r) > \pi^{-1}(s)$, \bullet is the multiplication of $gr(\mathcal{U}(\mathfrak{g}))$ and \circ is the multiplication of $\mathcal{U}(\mathfrak{g})$. We have

$$\mathcal{U}(\mathfrak{g}) = \oplus_{j \geq 0} \omega(gr^j(\mathcal{U}(\mathfrak{g})))$$

Theorem 6 Let $(\mathfrak{g}, [\cdot, \cdot])$ be a Color Lie algebra, $\mathcal{U}(\mathfrak{g})$ its universal enveloping algebra and the associated graded algebra $gr(\mathcal{U}(\mathfrak{g}))$. The symmetrization map ω defines a star product over the Color Poisson algebra $gr(\mathcal{U}(\mathfrak{g}))$ given by

$$u \star_t v = \sum_{n \geq 0} t^n \omega^{-1}((\omega(u) \circ \omega(v))_{p+q-n}) = \sum_{n=0}^{p+q-1} t^n \omega^{-1}((\omega(u) \circ \omega(v))_{p+q-n})$$

where $u \in gr^p(\mathcal{U}(\mathfrak{g}))$ and $v \in gr^q(\mathcal{U}(\mathfrak{g}))$.
