

# AN IMPROPER SURFACE GROUP ACTION

NIC BRODY

**ABSTRACT.** In 1999, Long and Reid proposed a proper action of a surface group on a product of trees. In this note, we show that the action is not proper.

The following question [2, 3, 4, 6] relates two of the most fundamental objects of consideration in low-dimensional topology and geometric group theory.

**Question 1.** Can a surface group act properly on a locally compact product of trees?

A folklore candidate action, first considered by Long and Reid in the 1990s, attempted to produce an explicit example of this. Let  $\Sigma$  denote the orbifold which is a torus with a single cone point of order 2. Its fundamental group is given by the presentation  $\pi_1(\Sigma) = \langle a, b \mid [a, b]^2 = 1 \rangle$ . Magnus [5] considers the  $\mathrm{PGL}_2$  character variety of this group. An element of  $\mathrm{PGL}_2$  has order 2 if and only if it has trace 0, and so we seek two matrices whose commutator has trace zero to obtain a representation of this group. Supposing the first matrix is  $a = \begin{pmatrix} t & 0 \\ 0 & 1 \end{pmatrix}$ , the second matrix  $b$  must satisfy  $2b_{11}b_{22} = (t + t^{-1})b_{12}b_{21}$ . We obtain

$$\left\langle \begin{pmatrix} t & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1+t^2 & 2 \\ t & 1 \end{pmatrix} \right\rangle \leq \mathrm{PGL}_2 \left( \mathbb{Z}[t] \left[ \frac{1}{t}, \frac{1}{t-1} \right] \right).$$

Any choice of real parameter  $t > 1$  determines a faithful representation of this group, because one can construct an explicit hyperbolic rectangle with this geometric structure. We now specialize to  $t = 9$ , and obtain the Long-Reid group

$$\Gamma = \left\langle \frac{1}{3} \begin{pmatrix} 9 & 0 \\ 0 & 1 \end{pmatrix}, \frac{1}{8} \begin{pmatrix} 82 & 2 \\ 9 & 1 \end{pmatrix} \right\rangle \leq \mathrm{PSL}_2 \left( \mathbb{Z} \left[ \frac{1}{6} \right] \right).$$

By [1],  $\mathrm{PGL}_2(\mathbb{Z}[1/6])$  is a lattice in  $\mathbb{H}^2 \times T_3 \times T_4$ , where  $T_k$  denotes the  $k$ -regular tree. The stabilizer of a (particular) vertex in  $T_3 \times T_4$  is  $\mathrm{PGL}_2(\mathbb{Z})$ , and the action of  $\Gamma$  on  $T_3 \times T_4$  is proper if and only if  $\Gamma \cap \mathrm{PGL}_2(\mathbb{Z})$  is finite.

**Theorem 1.** *The action of  $\Gamma$  on  $T_3 \times T_4$  is not proper.*

*Proof.* The length 82 word

$$a^2ba^{-2}b^{-1}aba^2b^{-1}a^{-1}b^{-1}a^2ba^{-1}ba^2b^{-1}a^{-1}b^{-1}abab^{-1}aba^{-1}ba^2b^{-1}a^3ba^{-2}b^{-1} \\ ab^{-1}a^{-2}b^2ab^{-1}a^{-2}ba^{-1}b^{-1}ab^{-1}a^{-2}bab^{-1}a^2ba^{-1}bab^{-1}aba^{-1}ba^2b^{-1}a^3ba^{-2}b^{-1}$$

evaluates to the infinite-order integer matrix

$$\begin{pmatrix} -646279884109511971664607 & 6162511442411222450262052 \\ -4193268331567764626734 & 39984323680432243295081 \end{pmatrix}.$$
