Abstract

For an n -vertex graph G , and a rooted graph $H^{(v)}$ with v as the root, the rooted product graph $G \circ H^{(v)}$ is obtained from G and n copies of H by identifying the root of the i th copy of H with the i th vertex of G for each i . As a refinement of the controllability criterion of $G \circ H^{(v)}$ obtained recently by Shan and Liu (2025), we obtain an explicit formula for the determinant of the walk matrix of $G \circ H^{(v)}$. Furthermore, for an important family of graphs \mathcal{F} that are determined by their generalized spectrum (DGS), we introduce the concept of \mathcal{F} -preservers and provide a sufficient condition for a rooted graph to be an \mathcal{F} -preserver. A list of \mathcal{F} -preservers of small order is provided, which leads to many new infinite families of DGS-graphs using rooted products.

Keywords: walk matrix; rooted product graph; generalized spectrum

Mathematics Subject Classification: 05C50

1 Introduction

Let G be a simple graph with n vertices, and let $M(G)$ be a real symmetric matrix associated with G . Throughout this paper, $M(G)$ may refer to adjacency matrix $A(G)$, signless Laplacian matrix $Q(G)$, and the A_α matrix $A_\alpha(G)$. The characteristic polynomial of $M(G)$, defined as $\det(xI - M(G))$, is called the M -characteristic polynomial of G and is denoted by $\phi(M(G); x)$. The M -walk matrix of G , denoted by $W_M(G)$, or $W(M(G))$, is defined to be the matrix

$$[e, M(G)e, \dots, (M(G))^{n-1}e],$$

where e is the all-ones vector. This particular kind of matrix has received increasing attention in spectral graph theory, as it has deep connection with many important properties of a graph. For example, a theorem of Wang [15] states that if $2^{-\lfloor n/2 \rfloor} \det(W_A(G))$ is odd and square-free, then G is determined by its generalized spectrum (DGS). In particular, all graphs G with

Figure 1: The rooted product graph $C_4 \circ C_3$

$\det W_A(G) = \pm 2^{\lfloor n/2 \rfloor}$ are DGS. For more studies on the walk matrices of graphs, we refer to [2, 4, 8, 9, 14, 16].

Let $H^{(v)}$ be a rooted graph with a root vertex v . The *rooted product graph* of G and $H^{(v)}$, denoted by $G \circ H^{(v)}$ (or simply $G \circ H$ when no confusion arises) is defined as follows: Take n copies of $H^{(v)}$ and identify the root v of the i th copy of $H^{(v)}$ with the i th vertex of G for each i . See Fig. 1 for an illustration. We are interested in the determinant of the walk matrix of the rooted product graph $G \circ H$. We may assume that H is not the trivial graph K_1 as $G \circ K_1 = G$. The first nontrivial result on $\det W(G \circ H)$ is obtained by Mao, Liu and Wang [6], which we state as the following theorem.

Theorem 1 ([6]). *For any graph G ,*

$$\det W_A(G \circ P_2) = \pm(\det A(G))(\det W_A(G))^2.$$

Similar formulas for $\det W_A(G \circ P_3)$ and $\det W_A(G \circ P_4)$ were obtained later by Mao and Wang [7], where the end vertex of P_3 (or P_4) is taken as the root. The general formula for $\det W_A(G \circ P_m)$ was conjectured by Mao and Wang [7] and proved by Wang, Yan and Mao [13]. Recently, Yan and Wang [17] further extended these results to any $P_m^{(\ell)}$, where the vertices of P_m are labeled naturally as $\{1, 2, \dots, m\}$ and the root ℓ can be arbitrary.

Theorem 2 ([17]). *For any graph G and integer $m \geq 2$,*

$$\det W_A(G \circ P_m^{(\ell)}) = \begin{cases} \pm(\det A(G))^{\lfloor \frac{m}{2} \rfloor} (\det W_A(G))^m, & \text{if } \gcd(\ell, m+1) = 1, \\ 0, & \text{otherwise.} \end{cases}$$

In [12], Tian et al. considered the Q -analog of the problem and proved that

$$\det W_Q(G \circ P_m) = \pm(\det Q(G))^{m-1}(\det W_Q(G))^2 \text{ for } m = 2, 3. \quad (1)$$

Yan, Wang and Mao [18] extended Eq. (1) for any $m \geq 2$.

Note that all the current results on $\det W(G \circ H^{(v)})$ are restricted to the case where H is the path graph. It seems natural to consider the general case, where H is an arbitrary graph. The main result of this paper is the following theorem, which establishes a general formula for $\det W_M(G \circ H^{(v)})$.

Theorem 3. *Let G be a graph of order n and $H^{(v)}$ be a rooted graph of order m . Let $B(\lambda) = M(H) + \lambda D_v$ where D_v is the diagonal matrix $\text{diag}(0, \dots, 0, 1, 0, \dots, 0)$ with only*

nonzero entry (which is 1) corresponding to the root v . Let $M^{(v)}(H)$ be the matrix obtained from $M(H)$ by deleting the row and the column corresponding to v . Then we have

$$\det W_M(G \circ H^{(v)}) = \pm (\text{Res}(\phi(M(H); x), \phi(M^{(v)}(H); x)))^{\frac{n(n-1)}{2}} \cdot \det h(M(G)) \cdot (\det W_M(G))^m,$$

where $h(\lambda) = \det W(B(\lambda)) = \det[e, B(\lambda)e, \dots, (B(\lambda))^{m-1}e]$.

A graph G is M -controllable if $\det W(M(G)) \neq 0$. Similarly, an $n \times n$ matrix B is controllable if $\det W(B) \neq 0$. Note that for two polynomials f and g , the resultant $\text{Res}(f, g)$ is nonzero if and only if $\gcd(f, g) = 1$. Also note that for any matrix M and any polynomial $h(x)$, it holds that $\det h(M) = \prod h(\lambda)$, where λ runs through all eigenvalues of M . An immediate consequence of Theorem 3 is the following necessary and sufficient condition for controllability of $G \circ H^{(v)}$, which was obtained by Shan and Liu [10].

Corollary 1. *The graph $G \circ H^{(v)}$ is M -controllable if and only if the following three conditions hold simultaneously:*

- (i) G is M -controllable;
- (ii) $\gcd(\phi(M(H); x), \phi(M^{(v)}(H); x)) = 1$; and
- (iii) for any eigenvalue λ of $M(G)$, the matrix $B(\lambda)$ is controllable.

We are most interested in Theorem 3 for the case where $M(G)$ refers to the adjacency matrix $A(G)$, as in this setting it gives a way to construct larger DGS-graphs from smaller ones, according to the aforementioned theorem of Wang [15]. It is worthwhile to mention that this construction fails in the setting of generalized Q spectrum; see [12].

For convenience, we introduce an important family of DGS-graphs.

Definition 1. *For an integer n , we define \mathcal{F}_n to be the collection of all n -vertex graphs G such that $\det A(G) = \pm 1$ and $\det W_A(G) = \pm 2^{\lfloor n/2 \rfloor}$. Define $\mathcal{F} = \bigcup \mathcal{F}_n$.*

We note that \mathcal{F}_n is empty when n is odd, since in this case $\det A(G) \equiv 0 \pmod{2}$, contradicting the requirement that $\det A(G) = \pm 1$. On the other hand, for all even $n \geq 6$, the families \mathcal{F}_n are nonempty; see [5, Fig. 1].

We call a rooted graph $H^{(v)}$ an \mathcal{F} -preserver if $G \circ H^{(v)} \in \mathcal{F}$ for any $G \in \mathcal{F}$. Since any graph in \mathcal{F} is DGS by the theorem of Wang [15], it is straightforward to use \mathcal{F} -preservers to construct an infinite family of DGS-graphs. Indeed, let G be any graph in \mathcal{F} and $\{H_i^{(v_i)}\}$ be a sequence of \mathcal{F} -preservers, not necessarily distinct. Then all graphs in the family

$$G, G \circ H_1^{(v_1)}, (G \circ H_1^{(v_1)}) \circ H_2^{(v_2)}, \dots$$

belong to the family \mathcal{F} and hence are DGS. The second main result of this paper is a sufficient condition for a rooted graph to be an \mathcal{F} -preserver, which we state as the following theorem using notation of Theorem 3.

Theorem 4. *A rooted graph $H^{(v)}$ is an \mathcal{F} -preserver if the following three conditions hold simultaneously:*

- (i) $\text{Res}(\phi(A(H); x), \phi(A^{(v)}(H); x)) = \pm 1$;
- (ii) $\det[e, B(\lambda)e, \dots, (B(\lambda))^{m-1}e] = \pm \lambda^k$ for some nonnegative integer k ; and
- (iii) either $\det A(H) = \pm 1$ and $\det A^{(v)}(H) = 0$, or $\det A(H) = 0$ and $\det A^{(v)}(H) = \pm 1$.

2 Proofs of Theorems 3 and 4

Let G be an n -vertex graph and $H^{(v)}$ be an m -vertex rooted graph with root v . We define $B(\lambda) = M(H) + \lambda D_v$, where D_v is the diagonal matrix $\text{diag}(0, \dots, 0, 1, 0, \dots, 0)$ with the number 1 corresponding to the root v . Let $M^{(v)}(H)$ be the matrix obtained from $M(H)$ by deleting the row and the column corresponding to the root vertex v . We mention that for adjacency matrix $A(G)$, the matrix $A^{(v)}(H)$ equals $A(H - v)$, where $H - v$ is the vertex-deleted subgraph of H . However, the corresponding equality does not hold for $Q(H)$ in general.

It was observed that $M(G \circ H^{(v)}) = M(H) \otimes I_n + D_v \otimes M(G)$ [10], where \otimes denotes the Kronecker product of matrices. The following lemma characterizes the M -eigenvalues and M -eigenvectors of $G \circ H^{(v)}$, generalizing the well-known result for the A -eigenvalues of $G \circ H^{(v)}$; see [1, 3, 11].

Lemma 1 ([10]). *Let $\lambda_1, \dots, \lambda_n$ be the eigenvalues of $M(G)$ with corresponding eigenvectors ξ_1, \dots, ξ_n . Let $\mu_i^{(j)}$ ($j \in \{1, \dots, m\}$) be the eigenvalues of $B(\lambda_i) = M(H) + \lambda_i D_v$ with corresponding eigenvectors $\zeta_i^{(j)}$. Denote $\tilde{M} = M(G \circ H^{(v)})$ and $\eta_i^{(j)} = \zeta_i^{(j)} \otimes \xi_i$. Then $\tilde{M}\eta_i^{(j)} = \mu_i^{(j)}\eta_i^{(j)}$ for $i \in \{1, \dots, n\}$ and $j \in \{1, \dots, m\}$.*

Proposition 1. $\det M(G \circ H^{(v)}) = \det((\det M(H)) \cdot I_n + (\det M^{(v)}(H)) \cdot M(G))$.

Proof. Using the notation of Lemma 1, we have

$$\det B(\lambda_i) = \det(M(H) + \lambda_i D_v) = \det M(H) + \lambda_i \det M^{(v)}(H)$$

by the multilinearity of the determinant. Since the determinant of a matrix equals the product of all its eigenvalues, we find that

$$\det M(G \circ H^{(v)}) = \prod_{i=1}^n \prod_{j=1}^m \mu_i^{(j)} = \prod_{i=1}^n \det B(\lambda_i) = \prod_{i=1}^n (\det M(H) + \lambda_i \det M^{(v)}(H)).$$

Let $M' = (\det M(H)) \cdot I_n + (\det M^{(v)}(H)) \cdot M(G)$. As $M(G)$ has eigenvalues $\lambda_1, \dots, \lambda_n$, we see that the eigenvalues of M' are exactly $\det M(H) + \lambda_i \det M^{(v)}(H)$. It follows that

$$\prod_{i=1}^n (\det M(H) + \lambda_i \det M^{(v)}(H)) = \det M'.$$

Thus, $\det M(G \circ H^{(v)}) = \det M'$, completing the proof. \square

The following corollary is immediate from Proposition 1.

Corollary 2. *If the rooted graph $H^{(v)}$ satisfies (i) $\det A(H) = \pm 1$ and $\det A^{(v)}(H) = 0$; or (ii) $\det A(H) = 0$ and $\det A^{(v)}(H) = \pm 1$, then $\det A(G \circ H^{(v)}) = \pm 1$ for any graph G with $\det A(G) = \pm 1$.*

Definition 2. Let $f(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$ and $g(x) = b_m x^m + b_{m-1} x^{m-1} + \dots + b_1 x + b_0$. The resultant of $f(x)$ and $g(x)$, denoted by $\text{Res}(f(x), g(x))$, is defined to be

$$a_n^m b_m^n \prod_{1 \leq i \leq n, 1 \leq j \leq m} (\alpha_i - \beta_j), \quad (2)$$

where α_i 's and β_j 's are the roots (in complex field \mathbb{C}) of $f(x)$ and $g(x)$, respectively.

We note that Eq. (2) can be rewritten as

$$a_n^m \prod_{1 \leq i \leq n} g(\alpha_i), \text{ or } (-1)^{mn} b_m^n \prod_{1 \leq j \leq m} f(\beta_j). \quad (3)$$

We shall use the following basic property of the resultant, which is clear from the second expression in Eq. (3).

Lemma 2. *Let $f(x) = a_n x^n + \cdots + a_0 = a_n \prod_{i=1}^n (x - \alpha_i)$ and $g(x) = b_m x^m + \cdots + b_0 = b_m \prod_{j=1}^m (x - \beta_j)$. If $m < n$, then $\text{Res}(f(x) + tg(x), g(x)) = \text{Res}(f(x), g(x))$ for any $t \in \mathbb{C}$.*

Now we turn to the calculation of $\det W(G \circ H^{(v)})$. The basic tool is the following formula which gives the determinant of walk matrix $W(M)$ using the eigenvalues and eigenvectors of M .

Lemma 3 ([6]). *Let M be an $n \times n$ real symmetric matrix. Let λ_i be the eigenvalues of M with corresponding eigenvectors ξ_i for $i = 1, 2, \dots, n$. Then*

$$\det W(M) = \frac{\prod_{1 \leq i_1 < i_2 \leq n} (\lambda_{i_2} - \lambda_{i_1}) \prod_{1 \leq i \leq n} (e_n^T \xi_i)}{\det[\xi_1, \xi_2, \dots, \xi_n]}.$$

Let $\Omega = \{(i, j) : 1 \leq i \leq n \text{ and } 1 \leq j \leq m\}$ with the colexicographical order: $(i_1, j_1) < (i_2, j_2)$ if either $j_1 < j_2$, or $j_1 = j_2$ and $i_1 < i_2$. The following formula for $\det W(G \circ H^{(v)})$ is an immediate consequence of Lemmas 1 and 3.

Corollary 3.

$$\det W(G \circ H^{(v)}) = \frac{\prod_{(i_1, j_1) < (i_2, j_2)} (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) \prod_{(i, j) \in \Omega} (e_{mn}^T \eta_i^{(j)})}{\det[\eta_1^{(1)}, \dots, \eta_n^{(1)}; \dots; \eta_1^{(m)}, \dots, \eta_n^{(m)}]}.$$

Lemma 4 ([17]).

$$\prod_{(i_1, j_1) < (i_2, j_2)} (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) = \pm \left(\prod_{i=1}^n \prod_{1 \leq j_1 < j_2 \leq m} (\mu_i^{(j_2)} - \mu_i^{(j_1)}) \right) \left(\prod_{1 \leq i_1 < i_2 \leq n} \prod_{j_2=1}^m \prod_{j_1=1}^m (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) \right).$$

Lemma 5.

$$\prod_{j_2=1}^m \prod_{j_1=1}^m (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) = (\lambda_{i_2} - \lambda_{i_1})^m \text{Res}(\phi(M(H); x), \phi(M^{(v)}(H); x)).$$

Proof. Note that $\phi(B(\lambda_i); x) = \det(xI - (M(H) + \lambda_i D_v)) = \phi(M(H); x) - \lambda_i \phi(M^{(v)}(H); x)$, which is a monic polynomial with roots $\mu_i^{(j)}$, $j = 1, \dots, m$. We find that

$$\phi(M(H); x) - \lambda_i \phi(M^{(v)}(H); x) = \prod_{j_1=1}^m (x - \mu_i^{(j_1)}),$$

and hence

$$\phi(M(H); \mu_{i_2}^{(j_2)}) - \lambda_{i_1} \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}) = \prod_{j_1=1}^m (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}). \quad (4)$$

As $\phi(M(H); \mu_{i_2}^{(j_2)}) - \lambda_{i_2} \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}) = 0$, we see that the left-hand side of Eq. (4) equals

$$(\lambda_{i_2} - \lambda_{i_1}) \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}),$$

implying

$$\prod_{j_2=1}^m \prod_{j_1=1}^m (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) = \prod_{j_2=1}^m (\lambda_{i_2} - \lambda_{i_1}) \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}) = (\lambda_{i_2} - \lambda_{i_1})^m \prod_{j_2=1}^m \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}). \quad (5)$$

Finally, by the definition of the resultant, we have

$$\begin{aligned} \prod_{j_2=1}^m \phi(M^{(v)}(H); \mu_{i_2}^{(j_2)}) &= \text{Res}(\phi(M(H); x) - \lambda_{i_2} \phi(M^{(v)}(H); x), \phi(M^{(v)}(H); x)) \\ &= \text{Res}(\phi(M(H); x), \phi(M^{(v)}(H); x)), \end{aligned}$$

where the last equality follows from Lemma 2 and the fact $\deg \phi(M^{(v)}(H); x) < \deg \phi(M(H); x)$. This, together with Eq. (5), completes the proof of Lemma 5. \square

Lemma 6.

$$\det[\eta_1^{(1)}, \dots, \eta_n^{(1)}; \dots; \eta_1^{(m)}, \dots, \eta_n^{(m)}] = (\det[\xi_1, \xi_2, \dots, \xi_n])^m \prod_{i=1}^n \det[\zeta_i^{(1)}, \zeta_i^{(2)}, \dots, \zeta_i^{(m)}].$$

Proof. Let $E^{(j)} = [\eta_1^{(j)}, \eta_2^{(j)}, \dots, \eta_n^{(j)}]$ for $j \in \{1, \dots, m\}$. Write $\zeta_i^{(j)} = (z_{i,1}^{(j)}, z_{i,2}^{(j)}, \dots, z_{i,m}^{(j)})^T$. Then, we have

$$\begin{aligned} E^{(j)} &= [\zeta_1^{(j)} \otimes \xi_1, \zeta_2^{(j)} \otimes \xi_2, \dots, \zeta_n^{(j)} \otimes \xi_n] \\ &= \begin{bmatrix} \begin{bmatrix} z_{1,1}^{(j)} \cdot \xi_1 \\ z_{1,2}^{(j)} \cdot \xi_1 \\ \vdots \\ z_{1,m}^{(j)} \cdot \xi_1 \end{bmatrix} & \begin{bmatrix} z_{2,1}^{(j)} \cdot \xi_2 \\ z_{2,2}^{(j)} \cdot \xi_2 \\ \vdots \\ z_{2,m}^{(j)} \cdot \xi_2 \end{bmatrix} & \dots & \begin{bmatrix} z_{n,1}^{(j)} \cdot \xi_n \\ z_{n,2}^{(j)} \cdot \xi_n \\ \vdots \\ z_{n,m}^{(j)} \cdot \xi_n \end{bmatrix} \end{bmatrix} \\ &= \begin{bmatrix} [\xi_1, \xi_2, \dots, \xi_n] \cdot \text{diag}[z_{1,1}^{(j)}, z_{2,1}^{(j)}, \dots, z_{n,1}^{(j)}] \\ [\xi_1, \xi_2, \dots, \xi_n] \cdot \text{diag}[z_{1,2}^{(j)}, z_{2,2}^{(j)}, \dots, z_{n,2}^{(j)}] \\ \vdots \\ [\xi_1, \xi_2, \dots, \xi_n] \cdot \text{diag}[z_{1,m}^{(j)}, z_{2,m}^{(j)}, \dots, z_{n,m}^{(j)}] \end{bmatrix}. \end{aligned} \quad (6)$$

Let $U = [\xi_1, \xi_2, \dots, \xi_n]$ and $T_{k,j} = \text{diag}[z_{1,k}^{(j)}, z_{2,k}^{(j)}, \dots, z_{n,k}^{(j)}]$ for $k, j \in \{1, 2, \dots, m\}$. Then we can rewrite Eq. (6) as

$$E^{(j)} = \begin{bmatrix} U \cdot T_{1,j} \\ U \cdot T_{2,j} \\ \vdots \\ U \cdot T_{m,j} \end{bmatrix} = \begin{bmatrix} U & & & \\ & U & & \\ & & \ddots & \\ & & & U \end{bmatrix} \begin{bmatrix} T_{1,j} \\ T_{2,j} \\ \vdots \\ T_{m,j} \end{bmatrix}.$$

This implies the following identity:

$$[E^{(1)}, E^{(2)}, \dots, E^{(m)}] = \begin{bmatrix} U & & & \\ & U & & \\ & & \ddots & \\ & & & U \end{bmatrix} \begin{bmatrix} T_{1,1} & T_{1,2} & \cdots & T_{1,m} \\ T_{2,1} & T_{2,2} & \cdots & T_{2,m} \\ \vdots & \vdots & & \vdots \\ T_{m,1} & T_{m,2} & \cdots & T_{m,m} \end{bmatrix}. \quad (7)$$

Since each $T_{k,j}$ is a diagonal matrix, one easily sees that the block matrix $(T_{k,j})$ is permutationally similar to the following block diagonal matrix

$$\text{diag}[[\zeta_1^{(1)}, \zeta_1^{(2)}, \dots, \zeta_1^{(m)}], [\zeta_2^{(1)}, \zeta_2^{(2)}, \dots, \zeta_2^{(m)}], \dots, [\zeta_n^{(1)}, \zeta_n^{(2)}, \dots, \zeta_n^{(m)}]].$$

Thus, taking determinants on both sides of Eq. (7) leads to

$$\det[E^{(1)}, E^{(2)}, \dots, E^{(m)}] = (\det U)^m \prod_{1 \leq i \leq n} \det[\zeta_i^{(1)}, \zeta_i^{(2)}, \dots, \zeta_i^{(m)}].$$

This completes the proof. \square

Now we are in a position to present proofs of Theorem 3 and Theorem 4.

Proof of Theorem 3 Note that $e_{mn}^T = e_m^T \otimes e_n^T$ and $\eta_i^j = \zeta_i^{(j)} \otimes \xi_i$. By the mixed-product property of Kronecker products, we find that

$$e_{mn}^T \eta_i^{(j)} = (e_m^T \otimes e_n^T)(\zeta_i^{(j)} \otimes \xi_i) = (e_m^T \zeta_i^{(j)})(e_n^T \xi_i).$$

Let $\Delta_1 = \text{Res}(\phi(M(H); x), \phi(M^{(v)}(H); x))$. It follows from Corollary 3, Lemmas 4, 5 and 6 that

$$\begin{aligned} & \det W_M(G \circ H^{(v)}) \\ &= \frac{\prod_{(i_1, j_1) < (i_2, j_2)} (\mu_{i_2}^{(j_2)} - \mu_{i_1}^{(j_1)}) \prod_{(i, j) \in \Omega} (e_{mn}^T \eta_i^{(j)})}{\det[\eta_1^{(1)}, \dots, \eta_n^{(1)}; \dots; \eta_1^{(m)}, \dots, \eta_n^{(m)}]} \\ &= \pm \frac{\left(\prod_{i=1}^n \prod_{1 \leq j_1 < j_2 \leq m} (\mu_i^{(j_2)} - \mu_i^{(j_1)}) \right) \left(\prod_{1 \leq i_1 < i_2 \leq n} (\lambda_{i_2} - \lambda_{i_1})^m \Delta_1 \right) \prod_{(i, j) \in \Omega} ((e_m^T \zeta_i^{(j)})(e_n^T \xi_i))}{(\det[\xi_1, \xi_2, \dots, \xi_n])^m \prod_{i=1}^n \det[\zeta_i^{(1)}, \zeta_i^{(2)}, \dots, \zeta_i^{(m)}]} \\ &= \pm \Delta_1^{\frac{n(n-1)}{2}} \left(\prod_{i=1}^n \frac{\prod_{1 \leq j_1 < j_2 \leq m} (\mu_i^{(j_2)} - \mu_i^{(j_1)}) \prod_{j=1}^m (e_m^T \zeta_i^{(j)})}{\det[\zeta_i^{(1)}, \zeta_i^{(2)}, \dots, \zeta_i^{(m)}]} \right) \\ & \quad \times \left(\frac{\prod_{1 \leq i_1 < i_2 \leq n} (\lambda_{i_2} - \lambda_{i_1}) \prod_{1 \leq i \leq n} (e_n^T \xi_i)}{\det[\xi_1, \xi_2, \dots, \xi_n]} \right)^m. \end{aligned} \quad (8)$$

Let Δ_2 and Δ_3 denote the last two factors of Eq. (8), respectively. Using Lemma 3 for both $W(B(\lambda_i))$ and $W(M(G))$, we find that

$$\Delta_2 = \prod_{i=1}^n \det W(B(\lambda_i)) \text{ and } \Delta_3 = (\det W(M(G)))^m.$$

Figure 2: A 4-vertex graph H

Let $h(\lambda) = \det W(B(\lambda))$. Noting that the eigenvalues of $h(M(G))$ are exactly $h(\lambda_1), \dots, h(\lambda_n)$, we obtain that

$$\Delta_2 = \prod_{i=1}^n h(\lambda_i) = \det h(M(G)).$$

This completes the proof of Theorem 3. \square

Proof of Theorem 4 Let n be even and G be any graph in \mathcal{F}_n . By the definition of \mathcal{F}_n , we know that $\det A(G) = \pm 1$ and $\det W_A(G) = \pm 2^{n/2}$. Suppose that $H^{(v)}$ satisfies all the three conditions of Theorem 4. Clearly, by Corollary 2, we have $\det A(G \circ H^{(v)}) = \pm 1$. Moreover, using Theorem 3, we find that

$$\det W_A(G \circ H^{(v)}) = \pm (\pm 1)^{\frac{n(n-1)}{2}} \cdot \det(\pm(A(G))^k)(\pm 2^{n/2})^m = \pm 2^{mn/2}.$$

Thus, $G \circ H^{(v)} \in \mathcal{F}$, i.e., $H^{(v)}$ is an \mathcal{F} -preserver. This completes the proof of Theorem 4.

3 Some examples and a conjecture

As an illustration of our main results (Theorems 3 and 4), we consider a specific 4-vertex graph H as shown in Fig. 2 and take the vertex 1 as the root. Direct calculations show that $\phi(A(H); x) = x^4 - 4x^2 - 2x + 1$ and $\phi(A^{(1)}(H); x) = x^3 - 2x$. The resultant of these two polynomials is equal to the determinant of their Sylvester matrix:

$$\text{Res}(\phi(A(H); x), \phi(A^{(1)}(H); x)) = \det \begin{pmatrix} 1 & 0 & -4 & -2 & 1 & 0 & 0 \\ 0 & 1 & 0 & -4 & -2 & 1 & 0 \\ 0 & 0 & 1 & 0 & -4 & -2 & 1 \\ 1 & 0 & -2 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & -2 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & -2 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & -2 & 0 \end{pmatrix} = 1.$$

As

$$B(\lambda) = A(H) + \lambda D_1 = \begin{pmatrix} \lambda & 1 & 1 & 0 \\ 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix},$$

Figure 3: Graph H_{4t+1}

we obtain

$$W(B(\lambda)) = [e, B(\lambda)e, (B(\lambda))^2e, (B(\lambda))^3e] = \begin{pmatrix} 1 & \lambda + 2 & \lambda^2 + 2\lambda + 5 & \lambda^3 + 2\lambda^2 + 7\lambda + 10 \\ 1 & 2 & \lambda + 5 & \lambda^2 + 3\lambda + 10 \\ 1 & 3 & \lambda + 5 & \lambda^2 + 3\lambda + 13 \\ 1 & 1 & 3 & \lambda + 5 \end{pmatrix}$$

and hence $\det W(B(\lambda)) = -\lambda^2$. It follows from Theorem 3 that, for this specific rooted graph $H^{(1)}$, we have

$$\det W_A(G \circ H^{(1)}) = \pm(\det A(G))^2(\det W_A(G))^4.$$

Furthermore, as $\det A(H) = 1$ and $\det A^{(1)}(H) = 0$, we find that all conditions of Theorem 4 are satisfied. This implies that the graph $H^{(1)}$ is an \mathcal{F} -preserver. Thus, if G is a graph in \mathcal{F} , then all graphs in the family

$$G, G \circ H^{(1)}, (G \circ H^{(1)}) \circ H^{(1)}, \dots$$

are in \mathcal{F} and hence are DGS by the theorem of Wang [15].

In [17], Yan and Wang consider a family of graphs H_{4t+1} of order $4t + 1$, as illustrated in Fig. 3. They conjectured that for $\ell = 2t + 1$ or $4t + 1$, it holds that

$$\det W_A(G \circ H_{4t+1}^{(\ell)}) = \pm(\det A(G))^{2t}(\det W_A(G))^{4t+1}.$$

(The two cases $\ell = 2t + 1$ and $\ell = 4t + 1$ are essentially the same as the corresponding two rooted graphs are isomorphic.) Although a complete proof of this conjecture is not available, it can be verified computationally for any fixed integer t based on Theorem 3, through a procedure similar to the one described above.

In the Appendix, we list all \mathcal{F} -preservers with order at most 10 that are found by an exhaustive search based on Theorem 4. The SageMath code for this search is available at https://github.com/wangweiAHPU/walk_det. Remarkably, for all the listed \mathcal{F} -preservers $H^{(v)}$, the determinant of $W_A(G \circ H^{(v)})$ exhibits a unified form dependent solely on the order of H . We propose the following conjecture for future investigation.

Conjecture 1. *If $H^{(v)}$ is an \mathcal{F} -preserver of order m , then for any graph G ,*

$$\det W_A(G \circ H^{(v)}) = \pm(\det A(G))^{\lfloor \frac{m}{2} \rfloor}(\det W_A(G))^m.$$
